**ORGANIC ELECTROLUMINESCENT
MATERIALS AND DEVICES****CROSS-REFERENCE TO RELATE
APPLICATIONS**

[0001] This application is a continuation-in-part of co-pending U.S. patent application Ser. No. 15/706,186, filed Sep. 15, 2017, that claims priority to U.S. Provisional application No. 62/403,424, filed Oct. 3, 2016, the disclosure of which is incorporated herein by reference.

FIELD

[0002] The present disclosure relates to compounds for use as phosphorescent emitters for organic electroluminescent devices, such as organic light emitting diodes (OLEDs). More specifically, the present disclosure relates to phosphorescent metal complexes containing ligands bearing either a naphthalene or other fused heterocycle moieties such as benzofuran and benzothiophene.

BACKGROUND

[0003] Opto-electronic devices that make use of organic materials are becoming increasingly desirable for a number of reasons. Many of the materials used to make such devices are relatively inexpensive, so organic opto-electronic devices have the potential for cost advantages over inorganic devices. In addition, the inherent properties of organic materials, such as their flexibility, may make them well suited for particular applications such as fabrication on a flexible substrate. Examples of organic opto-electronic devices include organic light emitting diodes/devices (OLEDs), organic phototransistors, organic photovoltaic cells, and organic photodetectors. For OLEDs, the organic materials may have performance advantages over conventional materials. For example, the wavelength at which an organic emissive layer emits light may generally be readily tuned with appropriate dopants.

[0004] OLEDs make use of thin organic films that emit light when voltage is applied across the device. OLEDs are becoming an increasingly interesting technology for use in applications such as flat panel displays, illumination, and backlighting. Several OLED materials and configurations are described in U.S. Pat. Nos. 5,844,363, 6,303,238, and 5,707,745, which are incorporated herein by reference in their entirety.

[0005] One application for phosphorescent emissive molecules is a full color display. Industry standards for such a display call for pixels adapted to emit particular colors, referred to as “saturated” colors. In particular, these standards call for saturated red, green, and blue pixels. Alternatively the OLED can be designed to emit white light. In conventional liquid crystal displays emission from a white backlight is filtered using absorption filters to produce red, green and blue emission. The same technique can also be used with OLEDs. The white OLED can be either a single EML device or a stack structure. Color may be measured using CIE coordinates, which are well known to the art.

[0006] One example of a green emissive molecule is tris(2-phenylpyridine) iridium, denoted Ir(ppy)₃, which has the following structure:

[0007] In this, and later figures herein, we depict the dative bond from nitrogen to metal (here, Ir) as a straight line.

[0008] As used herein, the term “organic” includes polymeric materials as well as small molecule organic materials that may be used to fabricate organic opto-electronic devices. “Small molecule” refers to any organic material that is not a polymer, and “small molecules” may actually be quite large. Small molecules may include repeat units in some circumstances. For example, using a long chain alkyl group as a substituent does not remove a molecule from the “small molecule” class. Small molecules may also be incorporated into polymers, for example as a pendant group on a polymer backbone or as a part of the backbone. Small molecules may also serve as the core moiety of a dendrimer, which consists of a series of chemical shells built on the core moiety. The core moiety of a dendrimer may be a fluorescent or phosphorescent small molecule emitter. A dendrimer may be a “small molecule” and it is believed that all dendrimers currently used in the field of OLEDs are small molecules.

[0009] As used herein, “top” means furthest away from the substrate, while “bottom” means closest to the substrate. Where a first layer is described as “disposed over” a second layer, the first layer is disposed further away from substrate. There may be other layers between the first and second layer, unless it is specified that the first layer is “in contact with” the second layer. For example, a cathode may be described as “disposed over” an anode, even though there are various organic layers in between.

[0010] As used herein, “solution processible” means capable of being dissolved, dispersed, or transported in and/or deposited from a liquid medium, either in solution or suspension form.

[0011] A ligand may be referred to as “photoactive” when it is believed that the ligand directly contributes to the photoactive properties of an emissive material. A ligand may be referred to as “ancillary” when it is believed that the ligand does not contribute to the photoactive properties of an emissive material, although an ancillary ligand may alter the properties of a photoactive ligand.

[0012] As used herein, and as would be generally understood by one skilled in the art, a first “Highest Occupied Molecular Orbital” (HOMO) or “Lowest Unoccupied Molecular Orbital” (LUMO) energy level is “greater than” or “higher than” a second HOMO or LUMO energy level if the first energy level is closer to the vacuum energy level. Since ionization potentials (IP) are measured as a negative energy relative to a vacuum level, a higher HOMO energy level corresponds to an IP having a smaller absolute value (an IP that is less negative). Similarly, a higher LUMO energy level corresponds to an electron affinity (EA) having a smaller absolute value (an EA that is less negative). On a conventional energy level diagram, with the vacuum level at the top, the LUMO energy level of a material is higher than

the HOMO energy level of the same material. A “higher” HOMO or LUMO energy level appears closer to the top of such a diagram than a “lower” HOMO or LUMO energy level.

[0013] As used herein, and as would be generally understood by one skilled in the art, a first work function is “greater than” or “higher than” a second work function if the first work function has a higher absolute value. Because work functions are generally measured as negative numbers relative to vacuum level, this means that a “higher” work function is more negative. On a conventional energy level diagram, with the vacuum level at the top, a “higher” work function is illustrated as further away from the vacuum level in the downward direction. Thus, the definitions of HOMO and LUMO energy levels follow a different convention than work functions.

[0014] More details on OLEDs, and the definitions described above, can be found in U.S. Pat. No. 7,279,704, which is incorporated herein by reference in its entirety.

SUMMARY

[0015] According to an aspect of the present disclosure, a compound comprising a ligand L_A of the Formula 1:

Formula I

is disclosed, where Ring B represents a five- or six-membered aromatic ring; R^3 represents from none to the maximum possible number of substitutions; X^1 , X^2 , X^3 , and X^4 are each independently a CR or N; wherein:

[0016] (1) at least two adjacent ones of X^1 , X^2 , X^3 , and X^4 are CR and fused into a five or six-membered aromatic ring, or

[0017] (2) at least one of X^1 , X^2 , X^3 , and X^4 is nitrogen, or

[0018] (3) both (1) and (2) are true:

[0019] wherein (a) R^1 is $CR^{11}R^{12}R^{13}$ or join with R^2 to form into a ring; or

[0020] (b) R^2 is not hydrogen; or

[0021] (c) both (a) and (b) are true:

[0022] wherein R, R^1 , R^2 , R^3 , R^{11} , R^{12} , and R^{13} are each independently selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof; any two substituents among R, R^1 , R^2 , R^3 , R^{11} , R^{12} , and R^{13} are optionally joined to form into a ring; L_A is coordinated to a metal M; L_A is optionally linked with other ligands to

comprise a tridentate, tetradentate, pentadentate, or hexadentate ligand; and M is optionally coordinated to other ligands.

[0023] According to another aspect, a formulation comprising a compound comprising the ligand L_A of Formula I is disclosed.

[0024] According to another aspect, an emissive region in an OLED is disclosed where the emissive region comprises a compound comprising the ligand L_A of Formula I.

[0025] According to another aspect, a first device comprising a first OLED is disclosed where the first OLED comprises an anode, a cathode, and an organic layer, disposed between the anode and the cathode, where the organic layer comprises a compound comprising the ligand L_A of Formula I.

[0026] According to another aspect, a consumer product comprising the first OLED is disclosed. The first OLED comprising an anode, a cathode, an organic layer, disposed between the anode and the cathode, where the organic layer comprises a compound comprising the ligand L_A of Formula I.

BRIEF DESCRIPTION OF THE DRAWINGS

[0027] FIG. 1 shows an organic light emitting device.

[0028] FIG. 2 shows an inverted organic light emitting device that does not have a separate electron transport layer.

DETAILED DESCRIPTION

[0029] Generally, an OLED comprises at least one organic layer disposed between and electrically connected to an anode and a cathode. When a current is applied, the anode injects holes and the cathode injects electrons into the organic layer(s). The injected holes and electrons each migrate toward the oppositely charged electrode. When an electron and hole localize on the same molecule, an “exciton,” which is a localized electron-hole pair having an excited energy state, is formed. Light is emitted when the exciton relaxes via a photoemissive mechanism. In some cases, the exciton may be localized on an excimer or an exciplex. Non-radiative mechanisms, such as thermal relaxation, may also occur, but are generally considered undesirable.

[0030] The initial OLEDs used emissive molecules that emitted light from their singlet states (“fluorescence”) as disclosed, for example, in U.S. Pat. No. 4,769,292, which is incorporated by reference in its entirety. Fluorescent emission generally occurs in a time frame of less than 10 nanoseconds.

[0031] More recently, OLEDs having emissive materials that emit light from triplet states (“phosphorescence”) have been demonstrated. Baldo et al., “Highly Efficient Phosphorescent Emission from Organic Electroluminescent Devices,” *Nature*, vol. 395, 151-154, 1998; (“Baldo-I”) and Baldo et al., “Very high-efficiency green organic light-emitting devices based on electrophosphorescence,” *Appl. Phys. Lett.*, vol. 75, No. 3, 4-6 (1999) (“Baldo-II”), are incorporated by reference in their entireties. Phosphorescence is described in more detail in U.S. Pat. No. 7,279,704 at cols. 5-6, which are incorporated by reference.

[0032] FIG. 1 shows an organic light emitting device 100. The figures are not necessarily drawn to scale. Device 100 may include a substrate 110, an anode 115, a hole injection layer 120, a hole transport layer 125, an electron blocking

layer **130**, an emissive layer **135**, a hole blocking layer **140**, an electron transport layer **145**, an electron injection layer **150**, a protective layer **155**, a cathode **160**, and a barrier layer **170**. Cathode **160** is a compound cathode having a first conductive layer **162** and a second conductive layer **164**. Device **100** may be fabricated by depositing the layers described, in order. The properties and functions of these various layers, as well as example materials, are described in more detail in U.S. Pat. No. 7,279,704 at cols. 6-10, which are incorporated by reference.

[0033] More examples for each of these layers are available. For example, a flexible and transparent substrate-anode combination is disclosed in U.S. Pat. No. 5,844,363, which is incorporated by reference in its entirety. An example of a p-doped hole transport layer is m-MTDATA doped with F₄-TCNQ at a molar ratio of 50:1, as disclosed in U.S. Patent Application Publication No. 2003/0230980, which is incorporated by reference in its entirety. Examples of emissive and host materials are disclosed in U.S. Pat. No. 6,303,238 to Thompson et al., which is incorporated by reference in its entirety. An example of an n-doped electron transport layer is BPhen doped with Li at a molar ratio of 1:1, as disclosed in U.S. Patent Application Publication No. 2003/0230980, which is incorporated by reference in its entirety. U.S. Pat. Nos. 5,703,436 and 5,707,745, which are incorporated by reference in their entireties, disclose examples of cathodes including compound cathodes having a thin layer of metal such as Mg:Ag with an overlying transparent, electrically-conductive, sputter-deposited ITO layer. The theory and use of blocking layers is described in more detail in U.S. Pat. No. 6,097,147 and U.S. Patent Application Publication No. 2003/0230980, which are incorporated by reference in their entireties. Examples of injection layers are provided in U.S. Patent Application Publication No. 2004/0174116, which is incorporated by reference in its entirety. A description of protective layers may be found in U.S. Patent Application Publication No. 2004/0174116, which is incorporated by reference in its entirety.

[0034] FIG. 2 shows an inverted OLED **200**. The device includes a substrate **210**, a cathode **215**, an emissive layer **220**, a hole transport layer **225**, and an anode **230**. Device **200** may be fabricated by depositing the layers described, in order. Because the most common OLED configuration has a cathode disposed over the anode, and device **200** has cathode **215** disposed under anode **230**, device **200** may be referred to as an “inverted” OLED. Materials similar to those described with respect to device **100** may be used in the corresponding layers of device **200**. FIG. 2 provides one example of how some layers may be omitted from the structure of device **100**.

[0035] The simple layered structure illustrated in FIGS. 1 and 2 is provided by way of non-limiting example, and it is understood that embodiments of the invention may be used in connection with a wide variety of other structures. The specific materials and structures described are exemplary in nature, and other materials and structures may be used. Functional OLEDs may be achieved by combining the various layers described in different ways, or layers may be omitted entirely, based on design, performance, and cost factors. Other layers not specifically described may also be included. Materials other than those specifically described may be used. Although many of the examples provided herein describe various layers as comprising a single material, it is understood that combinations of materials, such as

a mixture of host and dopant, or more generally a mixture, may be used. Also, the layers may have various sublayers. The names given to the various layers herein are not intended to be strictly limiting. For example, in device **200**, hole transport layer **225** transports holes and injects holes into emissive layer **220**, and may be described as a hole transport layer or a hole injection layer. In one embodiment, an OLED may be described as having an “organic layer” disposed between a cathode and an anode. This organic layer may comprise a single layer, or may further comprise multiple layers of different organic materials as described, for example, with respect to FIGS. 1 and 2.

[0036] Structures and materials not specifically described may also be used, such as OLEDs comprised of polymeric materials (PLEDs) such as disclosed in U.S. Pat. No. 5,247,190 to Friend et al., which is incorporated by reference in its entirety. By way of further example, OLEDs having a single organic layer may be used. OLEDs may be stacked, for example as described in U.S. Pat. No. 5,707,745 to Forrest et al, which is incorporated by reference in its entirety. The OLED structure may deviate from the simple layered structure illustrated in FIGS. 1 and 2. For example, the substrate may include an angled reflective surface to improve out-coupling, such as a mesa structure as described in U.S. Pat. No. 6,091,195 to Forrest et al., and/or a pit structure as described in U.S. Pat. No. 5,834,893 to Bulovic et al., which are incorporated by reference in their entireties.

[0037] Unless otherwise specified, any of the layers of the various embodiments may be deposited by any suitable method. For the organic layers, preferred methods include thermal evaporation, ink-jet, such as described in U.S. Pat. Nos. 6,013,982 and 6,087,196, which are incorporated by reference in their entireties, organic vapor phase deposition (OVPD), such as described in U.S. Pat. No. 6,337,102 to Forrest et al., which is incorporated by reference in its entirety, and deposition by organic vapor jet printing (OVJP), such as described in U.S. Pat. No. 7,431,968, which is incorporated by reference in its entirety. Other suitable deposition methods include spin coating and other solution based processes. Solution based processes are preferably carried out in nitrogen or an inert atmosphere. For the other layers, preferred methods include thermal evaporation. Preferred patterning methods include deposition through a mask, cold welding such as described in U.S. Pat. Nos. 6,294,398 and 6,468,819, which are incorporated by reference in their entireties, and patterning associated with some of the deposition methods such as ink-jet and OVJP. Other methods may also be used. The materials to be deposited may be modified to make them compatible with a particular deposition method. For example, substituents such as alkyl and aryl groups, branched or unbranched, and preferably containing at least 3 carbons, may be used in small molecules to enhance their ability to undergo solution processing. Substituents having 20 carbons or more may be used, and 3-20 carbons is a preferred range. Materials with asymmetric structures may have better solution processability than those having symmetric structures, because asymmetric materials may have a lower tendency to recrystallize. Dendrimer substituents may be used to enhance the ability of small molecules to undergo solution processing.

[0038] Devices fabricated in accordance with embodiments of the present invention may further optionally comprise a barrier layer. One purpose of the barrier layer is to protect the electrodes and organic layers from damaging

exposure to harmful species in the environment including moisture, vapor and/or gases, etc. The barrier layer may be deposited over, under or next to a substrate, an electrode, or over any other parts of a device including an edge. The barrier layer may comprise a single layer, or multiple layers. The barrier layer may be formed by various known chemical vapor deposition techniques and may include compositions having a single phase as well as compositions having multiple phases. Any suitable material or combination of materials may be used for the barrier layer. The barrier layer may incorporate an inorganic or an organic compound or both. The preferred barrier layer comprises a mixture of a polymeric material and a non-polymeric material as described in U.S. Pat. No. 7,968,146, PCT Pat. Application Nos. PCT/US2007/023098 and PCT/US2009/042829, which are herein incorporated by reference in their entireties. To be considered a "mixture", the aforesaid polymeric and non-polymeric materials comprising the barrier layer should be deposited under the same reaction conditions and/or at the same time. The weight ratio of polymeric to non-polymeric material may be in the range of 95:5 to 5:95. The polymeric material and the non-polymeric material may be created from the same precursor material. In one example, the mixture of a polymeric material and a non-polymeric material consists essentially of polymeric silicon and inorganic silicon.

[0039] Devices fabricated in accordance with embodiments of the invention can be incorporated into a wide variety of electronic component modules (or units) that can be incorporated into a variety of electronic products or intermediate components. Examples of such electronic products or intermediate components include display screens, lighting devices such as discrete light source devices or lighting panels, etc. that can be utilized by the end-user product manufacturers. Such electronic component modules can optionally include the driving electronics and/or power source(s). Devices fabricated in accordance with embodiments of the invention can be incorporated into a wide variety of consumer products that have one or more of the electronic component modules (or units) incorporated therein. A consumer product comprising an OLED that includes the compound of the present disclosure in the organic layer in the OLED is disclosed. Such consumer products would include any kind of products that include one or more light source(s) and/or one or more of some type of visual displays. Some examples of such consumer products include flat panel displays, computer monitors, medical monitors, televisions, billboards, lights for interior or exterior illumination and/or signaling, heads-up displays, fully or partially transparent displays, flexible displays, laser printers, telephones, cell phones, tablets, phablets, personal digital assistants (PDAs), wearable devices, laptop computers, digital cameras, camcorders, viewfinders, micro-displays (displays that are less than 2 inches diagonal), 3-D displays, virtual reality or augmented reality displays, vehicles, video walls comprising multiple displays tiled together, theater or stadium screen, and a sign. Various control mechanisms may be used to control devices fabricated in accordance with the present invention, including passive matrix and active matrix. Many of the devices are intended for use in a temperature range comfortable to humans, such as 18 degrees C. to 30 degrees C., and more preferably at room temperature (20-25 degrees C.), but

could be used outside this temperature range, for example, from -40 degree C. to +80 degree C.

[0040] The materials and structures described herein may have applications in devices other than OLEDs. For example, other optoelectronic devices such as organic solar cells and organic photodetectors may employ the materials and structures. More generally, organic devices, such as organic transistors, may employ the materials and structures.

[0041] The term "halo," "halogen," or "halide" as used herein includes fluorine, chlorine, bromine, and iodine.

[0042] The term "alkyl" as used herein contemplates both straight and branched chain alkyl radicals. Preferred alkyl groups are those containing from one to fifteen carbon atoms and includes methyl, ethyl, propyl, 1-methylethyl, butyl, 1-methylpropyl, 2-methylpropyl, pentyl, 1-methylbutyl, 2-methylbutyl, 3-methylbutyl, 1,1-dimethylpropyl, 1,2-dimethylpropyl, 2,2-dimethylpropyl, and the like. Additionally, the alkyl group may be optionally substituted.

[0043] The term "cycloalkyl" as used herein contemplates cyclic alkyl radicals. Preferred cycloalkyl groups are those containing 3 to 10 ring carbon atoms and includes cyclopropyl, cyclopentyl, cyclohexyl, adamantyl, and the like. Additionally, the cycloalkyl group may be optionally substituted.

[0044] The term "alkenyl" as used herein contemplates both straight and branched chain alkene radicals. Preferred alkenyl groups are those containing two to fifteen carbon atoms. Additionally, the alkenyl group may be optionally substituted.

[0045] The term "alkynyl" as used herein contemplates both straight and branched chain alkyne radicals. Preferred alkynyl groups are those containing two to fifteen carbon atoms. Additionally, the alkynyl group may be optionally substituted.

[0046] The terms "aralkyl" or "arylalkyl" as used herein are used interchangeably and contemplate an alkyl group that has as a substituent an aromatic group. Additionally, the aralkyl group may be optionally substituted.

[0047] The term "heterocyclic group" as used herein contemplates aromatic and non-aromatic cyclic radicals. Hetero-aromatic cyclic radicals also means heteroaryl. Preferred hetero-non-aromatic cyclic groups are those containing 3 to 7 ring atoms which includes at least one hetero atom, and includes cyclic amines such as morpholino, piperidino, pyrrolidino, and the like, and cyclic ethers, such as tetrahydrofuran, tetrahydropyran, and the like. Additionally, the heterocyclic group may be optionally substituted.

[0048] The term "aryl" or "aromatic group" as used herein contemplates single-ring groups and polycyclic ring systems. The polycyclic rings may have two or more rings in which two carbons are common to two adjoining rings (the rings are "fused") wherein at least one of the rings is aromatic, e.g., the other rings can be cycloalkyls, cycloalkenyls, aryl, heterocycles, and/or heteroaryls. Preferred aryl groups are those containing six to thirty carbon atoms, preferably six to twenty carbon atoms, more preferably six to twelve carbon atoms. Especially preferred is an aryl group having six carbons, ten carbons or twelve carbons. Suitable aryl groups include phenyl, biphenyl, triphenyl, triphenylene, tetraphenylene, naphthalene, anthracene, phenalene, phenanthrene, fluorene, pyrene, chrysene, perylene, and azulene, preferably phenyl, biphenyl, triphenyl, triphenylene, fluorene, and naphthalene. Additionally, the aryl group may be optionally substituted.

[0049] The term “heteroaryl” as used herein contemplates single-ring hetero-aromatic groups that may include from one to five heteroatoms. The term heteroaryl also includes polycyclic hetero-aromatic systems having two or more rings in which two atoms are common to two adjoining rings (the rings are “fused”) wherein at least one of the rings is a heteroaryl, e.g., the other rings can be cycloalkyls, cycloalkenyls, aryl, heterocycles, and/or heteroaryls. Preferred heteroaryl groups are those containing three to thirty carbon atoms, preferably three to twenty carbon atoms, more preferably three to twelve carbon atoms. Suitable heteroaryl groups include dibenzothiophene, dibenzofuran, dibenzoselenophene, furan, thiophene, benzofuran, benzothiophene, benzoselenophene, carbazole, indolocarbazole, pyridylindole, pyrrolodipyridine, pyrazole, imidazole, triazole, oxazole, thiazole, oxadiazole, oxatriazole, dioxazole, thiadiazole, pyridine, pyridazine, pyrimidine, pyrazine, triazine, oxazine, oxathiazine, oxadiazine, indole, benzimidazole, indazole, indoxazine, benzoxazole, benzisoxazole, benzothiazole, quinoline, isoquinoline, cinnoline, quinoxaline, naphthyridine, phthalazine, pteridine, xanthene, acridine, phenazine, phenothiazine, phenoxazine, benzofuropyridine, furodipyridine, benzothienopyridine, thienodipyridine, benzoselenophenopyridine, and selenophenodipyridine, preferably dibenzothiophene, dibenzofuran, dibenzoselenophene, carbazole, indolocarbazole, imidazole, pyridine, triazine, benzimidazole, 1,2-azaborine, 1,3-azaborine, 1,4-azaborine, borazine, and aza-analogs thereof. Additionally, the heteroaryl group may be optionally substituted.

[0050] The alkyl, cycloalkyl, alkenyl, alkynyl, aralkyl, heterocyclic group, aryl, and heteroaryl may be unsubstituted or may be substituted with one or more substituents selected from the group consisting of deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, cyclic amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkanyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ether, ester, nitrile, isonitrile, sulfanyl, sulfonyl, phosphino, and combinations thereof.

[0051] As used herein, “substituted” indicates that a substituent other than H is bonded to the relevant position, such as carbon. Thus, for example, where R^1 is mono-substituted, then one R^1 must be other than H. Similarly, where R^1 is di-substituted, then two of R^1 must be other than H. Similarly, where R^1 is unsubstituted, R^1 is hydrogen for all available positions.

[0052] The “aza” designation in the fragments described herein, i.e. aza-dibenzofuran, aza-dibenzothiophene, etc. means that one or more of the C—H groups in the respective fragment can be replaced by a nitrogen atom, for example, and without any limitation, azatriphenylene encompasses both dibenzo[f,h]quinoxaline and dibenzo[f,h]quinoline. One of ordinary skill in the art can readily envision other nitrogen analogs of the aza-derivatives described above, and all such analogs are intended to be encompassed by the terms as set forth herein.

[0053] It is to be understood that when a molecular fragment is described as being a substituent or otherwise attached to another moiety, its name may be written as if it were a fragment (e.g. phenyl, phenylene, naphthyl, dibenzofuryl) or as if it were the whole molecule (e.g. benzene, naphthalene, dibenzofuran). As used herein, these different ways of designating a substituent or attached fragment are considered to be equivalent.

[0054] The present disclosure relates to novel ligands for metal complexes. These ligands include a naphthalene or other similar fused heterocycles. In addition, this fused unit includes a blocking side chain which is a tert-Butyl or a tert-Butyl derivative. The combination of these elements within the ligand allows to obtain only one isomer of the final cyclometallated complex. It also affords a better efficiency, a red shift in the color of the emission as well as an emission that is narrower.

[0055] The present disclosure relates to phosphorescent metal complexes containing ligands bearing either a naphthalene or other fused heterocycle moieties such as benzofuran and benzothiophene. These moieties are substituted with an aliphatic side chain on the phenyl which is linked to the Iridium atom in a way where it will block the configuration and prevent any ligation at an unwanted position. The side chain is a tert-Butyl or a derivative of tert-Butyl. In addition to afford a material with a much better purity, the addition of the tert-Butyl side chain allows better EQE (external quantum efficiency), better FWHM (Full width at half maximum) of the emission. The fused cycles at the bottom of the ligand lead to a red shift of the color of the emission while the side chain on these cycles lead to a blue shift.

[0056] According to an aspect of the present disclosure, a compound comprising a ligand L_A of the Formula I:

Formula I

is disclosed, where Ring B represents a five- or six-membered aromatic ring; R^3 represents from none to the maximum possible number of substitutions;

X^1 , X^2 , X^3 , and X^4 are each independently a CR or N; wherein:

[0057] (1) at least two adjacent ones of X^1 , X^2 , X^3 , and X^4 are CR and fused into a five or six-membered aromatic ring, or

[0058] (2) at least one of X^1 , X^2 , X^3 , and X^4 is nitrogen, or

[0059] (3) both (1) and (2) are true;

[0060] wherein (a) R^1 is $CR^{11}R^{12}R^{13}$ or join with R^2 to form into a ring; or

[0061] (b) R^2 is not hydrogen; or

[0062] (c) both (a) and (b) are true;

[0063] wherein R, R^1 , R^2 , R^3 , R^{11} , R^{12} , and R^{13} are each independently selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfonyl, sulfonyl, phosphino, and combinations thereof;

[0064] any two substituents among R, R¹, R², R³, R¹¹, R¹², and R¹³ are optionally joined to form into a ring;

[0065] L_A is coordinated to a metal M;

[0066] L_A is optionally linked with other ligands to comprise a tridentate, tetradentate, pentadentate, or hexadentate ligand; and

[0067] M is optionally coordinated to other ligands.

[0068] In some embodiments of the compound, M is selected from the group consisting of Ir, Rh, Re, Ru, Os, Pt, Au, and Cu. In some embodiments, M is Ir or Pt.

[0069] In some embodiments of the compound, at least one of X¹, X², X³, and X⁴ is nitrogen.

[0070] In some embodiments of the compound, R¹ is tert-butyl or substituted tert-butyl. In some embodiments of the compound, R¹ and R² form into an aromatic ring, which can be further substituted.

[0071] In some embodiments of the compound. Ring B is phenyl.

[0072] In some embodiments of the compound, the ligand L_A is selected from the group consisting of:

-continued

wherein R¹, R², R⁴, R⁵, R⁶, R⁷, R⁸, R⁹, R¹⁰, R¹¹, R¹², R¹³, and R¹⁴ are each independently selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof; wherein any two substituents are optionally joined to form into a ring.

[0073] In some embodiments of the compound, the ligand L_A is selected from the group consisting of L_{A1} through L_{A260} which are based on a structure of Formula II,

which R¹, R², R⁴, and R⁵ are defined as provided below:

[0084] According to another aspect, a formulation comprising the compound comprising a ligand L_A of Formula I is disclosed.

[0085] According to another aspect, a first device comprising a first OLED is disclosed. The first OLED comprising: an anode; a cathode; and an organic layer, disposed between the anode and the cathode, comprising a compound comprising a ligand L_A of Formula I:

Formula I

where Ring B represents a five- or six-membered aromatic ring; R^3 represents from none to the maximum number of substitutions; X^1 , X^2 , X^3 , and X^4 are each independently a CR or N; wherein:

[0086] (1) at least two adjacent ones of X^1 , X^2 , X^3 , and X^4 are CR and fused into a five or six-membered aromatic ring, or

[0087] (2) at least one of X^1 , X^2 , X^3 , and X^4 is nitrogen, or

[0088] (3) both (1) and (2) are true;

[0089] wherein (a) R^1 is $CR^{11}R^{12}R^{13}$ or join with R^2 to form into a ring; or

[0090] (b) R^2 is not hydrogen; or

[0091] (c) both (a) and (b) are true;

[0092] wherein R , R^1 , R^2 , R^3 , R^{11} , R^{12} , and R^{13} are each independently selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof; any two substituents among R , R^1 , R^2 , R^3 , R^{11} , R^{12} , and R^{13} are optionally joined to form into a ring;

[0093] L_A is coordinated to a metal M;

[0094] L_A is optionally linked with other ligands to comprise a tridentate, tetradentate, pentadentate, or hexadentate ligand; and

[0095] M is optionally coordinated to other ligands.

[0096] In some embodiments of the first device, the organic layer further comprises a host, wherein host comprises at least one chemical group selected from the group consisting of carbazole, dibenzothiophene, dibenzofuran, dibenzoselenophene, azacarbazole, aza-dibenzothiophene, aza-dibenzofuran, and aza-dibenzoselenophene.

[0097] In some embodiments of the first device, the organic layer further comprises a host, wherein the host is selected from the Host Group A defined above.

[0098] In some embodiments of the first device, wherein the organic layer further comprises a host, wherein the host comprises a metal complex.

[0099] In some embodiments, the OLED has one or more characteristics selected from the group consisting of being flexible, being rollable, being foldable, being stretchable, and being curved. In some embodiments, the OLED is transparent or semi-transparent. In some embodiments, the OLED further comprises a layer comprising carbon nanotubes.

[0100] In some embodiments, the OLED further comprises a layer comprising a delayed fluorescent emitter. In some embodiments, the OLED comprises a RGB pixel arrangement or white plus color filter pixel arrangement. In some embodiments, the OLED is a mobile device, a hand held device, or a wearable device. In some embodiments, the OLED is a display panel having less than 10 inch diagonal or 50 square inch area. In some embodiments, the OLED is a display panel having at least 10 inch diagonal or 50 square inch area. In some embodiments, the OLED is a lighting panel.

[0101] According to another aspect, an emissive region in an OLED is disclosed where the emissive region comprising a compound comprising a ligand L_A of Formula I:

Formula I

where Ring B represents a five- or six-membered aromatic ring; R^3 represents from none to the maximum possible number of substitutions; X^1 , X^2 , X^3 , and X^4 are each independently a CR or N; wherein:

[0102] (1) at least two adjacent ones of X^1 , X^2 , X^3 , and X^4 are CR and fused into a five or six-membered aromatic ring, or

[0103] (2) at least one of X^1 , X^2 , X^3 , and X^4 is nitrogen, or

[0104] (3) both (1) and (2) are true;

[0105] wherein (a) R^1 is $CR^{11}R^{12}R^{13}$ or join with R^2 to form into a ring; or

[0106] (b) R^2 is not hydrogen; or

[0107] (c) both (a) and (b) are true;

[0108] wherein R, R¹, R², R³, R¹¹, R¹², and R¹³ are each independently selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof;

[0109] any two substituents among R, R¹, R², R³, R¹¹, R¹², and R¹³ are optionally joined to form into a ring;

[0110] L_A is coordinated to a metal M;

[0111] L_A is optionally linked with other ligands to comprise a tridentate, tetradentate, pentadentate, or hexadentate ligand; and

[0112] M is optionally coordinated to other ligands.

[0113] In some embodiments of the emissive region, the compound is an emissive dopant or a non-emissive dopant.

[0114] In some embodiments of the emissive region, the emissive region further comprises a host, wherein the host comprises at least one selected from the group consisting of metal complex, triphenylene, carbazole, dibenzothiophene, dibenzofuran, dibenzoselenophene, aza-triphenylene, aza-carbazole, aza-dibenzothiophene, aza-dibenzofuran, and aza-dibenzoselenophene.

[0115] In some embodiments of the emissive region, wherein the emissive region further comprises a host, wherein the host is selected from the following Host Group A consisting of:

-continued

-continued

-continued

-continued

and combinations thereof.

[0116] According to another aspect, a consumer product comprising the OLED that includes the compound of the present disclosure in the organic layer of the OLED is disclosed.

[0117] In some embodiments, the compound can be an emissive dopant. In some embodiments, the compound can produce emissions via phosphorescence, fluorescence, thermally activated delayed fluorescence, i.e., TADF (also referred to as E-type delayed fluorescence), triplet-triplet annihilation, or combinations of these processes.

[0118] According to another aspect, a formulation comprising the compound described herein is also disclosed.

[0119] The OLED disclosed herein can be incorporated into one or more of a consumer product, an electronic component module, and a lighting panel. The organic layer can be an emissive layer and the compound can be an emissive dopant in some embodiments, while the compound can be a non-emissive dopant in other embodiments.

[0120] The organic layer can also include a host. In some embodiments, two or more hosts are preferred. In some embodiments, the hosts used may be a) bipolar, b) electron transporting, c) hole transporting or d) wide band gap materials that play little role in charge transport. In some embodiments, the host can include a metal complex. The host can be a triphenylene containing benzo-fused thiophene or benzo-fused furan. Any substituent in the host can be an unfused substituent independently selected from the group consisting of C_nH_{2n+1} , OC_nH_{2n+1} , OAr_1 , $N(C_nH_{2n+1})_2$,

$N(Ar_1)(Ar_2)$, $CH=CH-C_nH_{2n+1}$, $C\equiv C-C_nH_{2n+1}$, Ar_1 , Ar_1-Ar_2 , and $C_nH_{2n}-Ar_1$, or the host has no substitutions. In the preceding substituents n can range from 1 to 10; and Ar_1 and Ar_2 can be independently selected from the group consisting of benzene, biphenyl, naphthalene, triphenylene, carbazole, and heteroaromatic analogs thereof. The host can be an inorganic compound. For example a Zn containing inorganic material e.g. ZnS.

[0121] The host can be a compound comprising at least one chemical group selected from the group consisting of triphenylene, carbazole, dibenzothiophene, dibenzofuran, dibenzoselenophene, azatriphenylene, azacarbazole, aza-dibenzothiophene, aza-dibenzofuran, and aza-dibenzoselenophene. The host can include a metal complex. The host can be, but is not limited to, a specific compound selected from the group consisting of:

-continued

-continued

-continued

-continued

and combinations thereof. Additional information on possible hosts is provided below.

[0122] In yet another aspect of the present disclosure, a formulation that comprises the novel compound disclosed herein is described. The formulation can include one or more components selected from the group consisting of a solvent, a host, a hole injection material, hole transport material, and an electron transport layer material, disclosed herein.

[0123] Combination with Other Materials

[0124] The materials described herein as useful for a particular layer in an organic light emitting device may be used in combination with a wide variety of other materials present in the device. For example, emissive dopants disclosed herein may be used in conjunction with a wide variety of hosts, transport layers, blocking layers, injection layers, electrodes and other layers that may be present. The materials described or referred to below are non-limiting examples of materials that may be useful in combination with the compounds disclosed herein, and one of skill in the art can readily consult the literature to identify other materials that may be useful in combination.

[0125] Conductivity Dopants:

[0126] A charge transport layer can be doped with conductivity dopants to substantially alter its density of charge carriers, which will in turn alter its conductivity. The conductivity is increased by generating charge carriers in the matrix material, and depending on the type of dopant, a change in the Fermi level of the semiconductor may also be achieved. Hole-transporting layer can be doped by p-type conductivity dopants and n-type conductivity dopants are used in the electron-transporting layer.

[0127] Non-limiting examples of the conductivity dopants that may be used in an OLED in combination with materials

disclosed herein are exemplified below together with references that disclose those materials: EP01617493, EP01968131, EP2020694, EP2684932, US20050139810, US20070160905, US20090167167, US2010288362, WO06081780, WO2009003455, WO2009008277, WO2009011327, WO2014009310, US2007252140, US2015060804 and US2012146012.

**[0128]** HIL/HTL:

[0129] A hole injecting/transporting material to be used in the present invention is not particularly limited, and any compound may be used as long as the compound is typically used as a hole injecting/transporting material. Examples of the material include, but are not limited to: a phthalocyanine or porphyrin derivative; an aromatic amine derivative; an indolocarbazole derivative; a polymer containing fluorohydrocarbon; a polymer with conductivity dopants; a conducting polymer, such as PEDOT/PSS; a self-assembly monomer derived from compounds such as phosphonic acid and silane derivatives; a metal oxide derivative, such as MoO_x ; a p-type semiconducting organic compound, such as 1,4,5,8,9,12-Hexaazatriphenylenehexacarbonitrile; a metal complex, and a cross-linkable compounds.

[0130] Examples of aromatic amine derivatives used in HIL or HTL include, but not limit to the following general structures:

-continued

[0131] Each of Ar^1 to Ar^9 is selected from the group consisting of aromatic hydrocarbon cyclic compounds such as benzene, biphenyl, triphenyl, triphenylene, naphthalene, anthracene, phenalene, phenanthrene, fluorene, pyrene, chrysene, perylene, and azulene; the group consisting of aromatic heterocyclic compounds such as dibenzothio-
 phene, dibenzofuran, dibenzoselenophene, furan, thiophene, benzofuran, benzothiophene, benzoselenophene, carbazole, indolocarbazole, pyridylindole, pyrrolodipyridine, pyrazole, imidazole, triazole, oxazole, thiazole, oxadiazole, oxatriaz-
 ole, dioxazole, thiadiazole, pyridine, pyridazine, pyrimidine, pyrazine, triazine, oxazine, oxathiazine, oxadiazine, indole, benzimidazole, indazole, indoxazine, benzoxazole, ben-
 zisoxazole, benzothiazole, quinoline, isoquinoline, cinnoline, quinazoline, quinoxaline, naphthyridine, phthalazine, pteridine, xanthene, acridine, phenazine, phenothiazine,
 phenoxazine, benzofuopyridine, furodipyridine, benzoth-
 ienopyridine, thienodipyridine, benzoselenophenopyridine, and selenophenodipyridine; and the group consisting of 2 to 10 cyclic structural units which are groups of the same type or different types selected from the aromatic hydrocarbon cyclic group and the aromatic heterocyclic group and are bonded to each other directly or via at least one of oxygen atom, nitrogen atom, sulfur atom, silicon atom, phosphorus atom, boron atom, chain structural unit and the aliphatic cyclic group. Each Ar may be unsubstituted or may be substituted by a substituent selected from the group consist-
 ing of deuterium, halide, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalk-
 enyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acids, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof.

[0132] In one aspect, Ar^1 to Ar^9 is independently selected from the group consisting of:

[0133] wherein k is an integer from 1 to 20; X^{101} to X^{108} is C (including CH) or N; Z^{101} is NAr^1 , O, or S; Ar^1 has the same group defined above.

[0134] Examples of metal complexes used in HIL or HTL include, but are not limited to the following general formula:

[0135] wherein Met is a metal, which can have an atomic weight greater than 40; $(\text{Y}^{101}-\text{Y}^{102})$ is a bidentate ligand, Y^{101} and Y^{102} are independently selected from C, N, O, P, and S; L^{101} is an ancillary ligand; k' is an integer value from 1 to the maximum number of ligands that may be attached to the metal; and $k'+k''$ is the maximum number of ligands that may be attached to the metal.

[0136] In one aspect, $(\text{Y}^{101}-\text{Y}^{102})$ is a 2-phenylpyridine derivative. In another aspect, $(\text{Y}^{101}-\text{Y}^{102})$ is a carbene ligand. In another aspect, Met is selected from Ir, Pt, Os, and Zn. In a further aspect, the metal complex has a smallest oxidation potential in solution vs. Fc^+/Fc couple less than about 0.6 V.

[0137] Non-limiting examples of the HIL and HTL materials that may be used in an OLED in combination with materials disclosed herein are exemplified below together with references that disclose those materials: CN102702075, DE102012005215, EP01624500, EP01698613, EP01806334, EP01930964, EP01972613, EP01997799, EP02011790, EP02055700, EP02055701, EP1725079, EP2085382, EP2660300, EP650955, JP07-073529, JP2005112765, JP2007091719, JP2008021687, JP2014-009196, KR20110088898, KR20130077473, TW201139402, U.S. Ser. [0138] EBL:

[0139] An electron blocking layer (EBL) may be used to reduce the number of electrons and/or excitons that leave the emissive layer. The presence of such a blocking layer in a device may result in substantially higher efficiencies, and/or longer lifetime, as compared to a similar device lacking a blocking layer. Also, a blocking layer may be used to confine emission to a desired region of an OLED. In some embodiments, the EBL material has a higher LUMO (closer to the vacuum level) and/or higher triplet energy than the emitter closest to the EBL interface. In some embodiments, the EBL material has a higher LUMO (closer to the vacuum level) and/or higher triplet energy than one or more of the hosts closest to the EBL interface. In one aspect, the compound used in EBL contains the same molecule or the same functional groups used as one of the hosts described below.

[0140] Host:

[0141] The light emitting layer of the organic EL device of the present invention preferably contains at least a metal complex as light emitting material, and may contain a host material using the metal complex as a dopant material. Examples of the host material are not particularly limited, and any metal complexes or organic compounds may be used as long as the triplet energy of the host is larger than that of the dopant. Any host material may be used with any dopant so long as the triplet criteria is satisfied.

[0142] Examples of metal complexes used as host are preferred to have the following general formula:

[0143] wherein Met is a metal; (Y¹⁰³—Y¹⁰⁴) is a bidentate ligand, Y¹⁰³ and Y¹⁰⁴ are independently selected from C, N, O, P, and S; L¹⁰¹ is another ligand; k' is an integer value from 1 to the maximum number of ligands that may be

attached to the metal; and k'+k'' is the maximum number of ligands that may be attached to the metal.

[0144] In one aspect, the metal complexes are:

[0145] wherein (O—N) is a bidentate ligand, having metal coordinated to atoms O and N.

[0146] In another aspect, Met is selected from Ir and Pt. In a further aspect, (Y¹⁰³—Y¹⁰⁴) is a carbene ligand.

[0147] Examples of other organic compounds used as host are selected from the group consisting of aromatic hydrocarbon cyclic compounds such as benzene, biphenyl, triphenyl, triphenylene, tetraphenylene, naphthalene, anthracene, phenalene, phenanthrene, fluorene, pyrene, chrysene, perylene, and azulene; the group consisting of aromatic heterocyclic compounds such as dibenzothiophene, dibenzofuran, dibenzoselenophene, furan, thiophene, benzofuran, benzothiophene, benzoselenophene, carbazole, indolocarbazole, pyridylindole, pyrrolodipyridine, pyrazole, imidazole, triazole, oxazole, thiazole, oxadiazole, oxatriazole, dioxazole, thiadiazole, pyridine, pyridazine, pyrimidine, pyrazine, triazine, oxazine, oxathiazine, oxadiazine, indole, benzimidazole, indazole, indoxazine, benzoxazole, benzisoxazole, benzothiazole, quinoline, isoquinoline, cinoline, quinazoline, quinoxaline, naphthyridine, phthalazine, pteridine, xanthene, acridine, phenazine, phenothiazine, phenoxazine, benzofuroypyridine, furodipyridine, benzothenopyridine, thienodipyridine, benzoselenophenopyridine, and selenophenodipyridine; and the group consisting of 2 to 10 cyclic structural units which are groups of the same type or different types selected from the aromatic hydrocarbon cyclic group and the aromatic heterocyclic group and are bonded to each other directly or via at least one of oxygen atom, nitrogen atom, sulfur atom, silicon

atom, phosphorus atom, boron atom, chain structural unit and the aliphatic cyclic group. Each option within each group may be unsubstituted or may be substituted by a substituent selected from the group consisting of deuterium, halide, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acids, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof.

[0148] In one aspect, the host compound contains at least one of the following groups in the molecule:

[0149] wherein each of R^{101} to R^{107} is independently selected from the group consisting of hydrogen, deuterium, halide, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acids, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof, and when it is aryl or heteroaryl, it has the similar definition as Ar's mentioned above, k is an integer from 0 to 20 or 1 to 20; k'' is an integer from 0 to 20. X^{101} to X^{108} is selected from C (including CH) or N.

[0150] Z^{101} and Z^{102} is selected from NR^{101} , O, or S.

[0151] Non-limiting examples of the host materials that may be used in an OLED in combination with materials disclosed herein are exemplified below together with references that disclose those materials: EP2034538, EP2034538A, EP2757608, JP2007254297, KR20100079458, KR20120088644, KR20120129733, KR20130115564, TW201329200, US20030175553, US20050238919, US20060280965, US20090017330, US20090030202, US20090167162, US20090302743, US20090309488, US20100012931, US20100084966, US20100187984, US2010187984, US2012075273, US2012126221, US2013009543, US2013105787, US2013175519, US2014001446, US20140183503, US20140225088, US2014034914, U.S. Pat. [0152] Additional Emitters:

[0153] One or more additional emitter dopants may be used in conjunction with the compound of the present disclosure. Examples of the additional emitter dopants are not particularly limited, and any compounds may be used as long as the compounds are typically used as emitter materials. Examples of suitable emitter materials include, but are not limited to, compounds which can produce emissions via phosphorescence, fluorescence, thermally activated delayed fluorescence, i.e., TADF (also referred to as E-type delayed fluorescence), triplet-triplet annihilation, or combinations of these processes.

[0154] Non-limiting examples of the emitter materials that may be used in an OLED in combination with materials disclosed herein are exemplified below together with references that disclose those materials: CN103694277, CN1696137, EB01238981, EP01239526, EP01961743, EP1239526, EP1244155, EP1642951, EP1647554, EP1841834, EP1841834B, EP2062907, EP2730583, JP2012074444, JP2013110263, JP4478555, KR1020090133652, KR20120032054, KR20130043460, TW201332980, U.S. Ser. [0155] HBL:

[0156] A hole blocking layer (HBL) may be used to reduce the number of holes and/or excitons that leave the emissive layer. The presence of such a blocking layer in a device may result in substantially higher efficiencies and/or longer life-time as compared to a similar device lacking a blocking layer. Also, a blocking layer may be used to confine emission to a desired region of an OLED. In some embodiments, the HBL material has a lower HOMO (further from the vacuum level) and/or higher triplet energy than the emitter closest to the HBL interface. In some embodiments, the HBL material has a lower HOMO (further from the vacuum level) and/or higher triplet energy than one or more of the hosts closest to the HBL interface.

[0157] In one aspect, compound used in HBL contains the same molecule or the same functional groups used as host described above.

[0158] In another aspect, compound used in HBL contains at least one of the following groups in the molecule:

wherein k is an integer from 1 to 20; L^{101} is an another ligand, k' is an integer from 1 to 3.

[0159] ETL:

[0160] Electron transport layer (ETL) may include a material capable of transporting electrons. Electron transport layer may be intrinsic (undoped), or doped. Doping may be used to enhance conductivity. Examples of the ETL material are not particularly limited, and any metal complexes or organic compounds may be used as long as they are typically used to transport electrons.

[0161] In one aspect, compound used in ETL contains at least one of the following groups in the molecule:

wherein R^{101} is selected from the group consisting of hydrogen, deuterium, halide, alkyl, cycloalkyl, heteroalkyl, aryl-alkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acids, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof, when it is aryl or heteroaryl, it has the similar definition as Ar's mentioned above. Ar^1 to Ar^3 has the similar definition as Ar's mentioned above. k is an integer from 1 to 20. X^{101} to X^{108} is selected from C (including CH) or N.

[0162] In another aspect, the metal complexes used in ETL contains, but not limit to the following general formula:

wherein (O—N) or (N—N) is a bidentate ligand, having metal coordinated to atoms O, N or N, N; L^{101} is another

ligand; k' is an integer value from 1 to the maximum number of ligands that may be attached to the metal.

[0163] Non-limiting examples of the ETL materials that may be used in an OLED in combination with materials disclosed herein are exemplified below together with references that disclose those materials: CN103508940, EP01602648, EP01734038, EP01956007, JP2004-022334, JP2005149918, JP2005-268199, KR0117693, KR20130108183, US20040036077, US20070104977, US2007018155, US20090101870, US20090115316, US20090140637, US20090179554, US2009218940, US2010108990, US2011156017, US2011210320, US2012193612, US2012214993, US2014014925, US2014014927, US20140284580, U.S. Pat. **[0164]** Charge Generation Layer (CGL)

[0165] In tandem or stacked OLEDs, the CGL plays an essential role in the performance, which is composed of an n-doped layer and a p-doped layer for injection of electrons and holes, respectively. Electrons and holes are supplied from the CGL and electrodes. The consumed electrons and holes in the CGL are refilled by the electrons and holes injected from the cathode and anode, respectively; then, the bipolar currents reach a steady state gradually. Typical CGL materials include n and p conductivity dopants used in the transport layers.

[0166] In any above-mentioned compounds used in each layer of the OLED device, the hydrogen atoms can be partially or fully deuterated. Thus, any specifically listed substituent, such as, without limitation, methyl, phenyl, pyridyl, etc. may be undeuterated, partially deuterated, and fully deuterated versions thereof. Similarly, classes of substituents such as, without limitation, alkyl, aryl, cycloalkyl, heteroaryl, etc. also may be undeuterated, partially deuterated, and fully deuterated versions thereof.

Synthesis**[0167]** Materials Synthesis—

[0168] All reactions were carried out under nitrogen atmosphere unless specified otherwise. All solvents for reactions are anhydrous and used as received from commercial sources.

Synthesis of Compound 3393 [Ir(L₄₁₇)₂(L_{B5})]**Synthesis of 6-(tert-butyl)-4-chloro-2H-pyran-2-one****[0169]**

A solution of 6-(tert-butyl)-4-hydroxy-2H-pyran-2-one (9.50 g, 56.50 mmol), POCl₃ (31.9 mL, 198 mmol) and NEt₃ (7.8 mL, 56.50 mmol) was heated to reflux overnight. The

reaction flask was cooled to rt and the reaction mixture was quenched with ice and extracted with EtOAc. The crude product was adsorbed onto Celite and purified via flash chromatography ($\text{CH}_2\text{Cl}_2/\text{EtOAc}/\text{Heptanes}$, 1:4:45) to provide 6-(tert-butyl)-4-chloro-2H-pyran-2-one as a golden oil (10.0 g, 95%).

Synthesis of 1-(tert-butyl)-3-chloronaphthalene

[0170]

A solution of 6-(tert-butyl)-4-chloro-2H-pyran-2-one (8.90 g, 47.70 mmol) in 1,2-Dimethoxyethane (100 mL) was heated to 100°C . Subsequently, isoamyl nitrite (9.63 mL, 71.50 mmol), previously dissolved in 1,2-Dimethoxyethane (60 mL), and 2-aminobenzoic acid (9.81 g, 71.50 mmol), previously dissolved in 1,2-Dimethoxyethane (60 mL), were added to the reaction mixture simultaneously with the aid of addition funnels in a dropwise fashion. The reaction mixture was left to stir at 100°C overnight. The reaction flask was cooled to rt and the reaction mixture was concentrated in vacuo. The crude product was adsorbed onto Celite and purified via flash chromatography ($\text{CH}_2\text{Cl}_2/\text{EtOAc}/\text{Heptanes}$, 1:2:47) to provide 1-(tert-butyl)-3-chloronaphthalene as a light yellow oil (6.7 g, 64%).

Synthesis of 2-(4-(tert-butyl)naphthalen-2-yl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane

[0171]

-continued

A solution of 1-(tert-butyl)-3-chloronaphthalene (6.20 g, 28.30 mmol), 4,4,4',4',5,5',5',5'-octamethyl-2,2'-bi(1,3,2-dioxaborolane) (9.36 g, 36.90 mmol), $\text{Pd}_2(\text{dba})_3$ (0.52 g, 0.57 mmol), SPhos (0.93 g, 2.27 mmol), and KOAc (8.35 g, 85.00 mmol) in 1,4-Dioxane (90 mL) was heated to 110°C for 17 h. After this time, the reaction flask was cooled to rt and the reaction mixture was filtered through a plug of Celite, eluting with EtOAc, and concentrated in vacuo. The crude product was adsorbed onto Celite and purified via flash chromatography (EtOAc/Heptanes, 1:49 to 1:9) to provide 2-(4-(tert-butyl)naphthalen-2-yl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane as an off-white solid (8.80 g, 93%).

Synthesis of 2-(4-(tert-butyl)naphthalen-2-yl)-4,5-dichloroquinoline

[0172]

2-(4-(tert-butyl)naphthalen-2-yl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (4.31 g, 13.90 mmol), 2,4,5-trichloroquinoline (3.20 g, 13.76 mmol), K_2CO_3 (5.71 g, 41.30 mmol) THF (51 mL) and H_2O (17 mL) were combined in a flask. The

reaction mixture was purged with N_2 for 15 min followed by the addition of $Pd(PPh_3)_4$ (0.80 g, 0.69 mmol). The reaction mixture was then heated to $75^\circ C.$ for 16 h. After this time, the reaction flask was cooled to rt and the reaction mixture was extracted with EtOAc. The crude product was adsorbed onto Celite and purified via flash chromatography (EtOAc/Heptanes, 1:49) to provide 2-(4-(tert-butyl)naphthalen-2-yl)-4,5-dichloroquinoline as a yellow solid (5.50 g, 99%).

Synthesis of 2-(4-(tert-butyl)naphthalen-2-yl)-4,5-dimethylquinoline

[0173]

A solution of 2-(4-(tert-butyl)naphthalen-2-yl)-4,5-dichloroquinoline (5.50 g, 14.46 mmol), $Pd_2(dba)_3$ (0.53 g, 0.58 mmol), SPhos (0.95 g, 2.31 mmol), trimethylboroxine (4.85 mL, 34.70 mmol) and K_3PO_4 (12.28 g, 57.80 mmol) in Toluene (65.0 mL) and H_2O (6.50 mL), purged with N_2 for 15 min, and was heated to $100^\circ C.$ for 19 h. After this time, the reaction flask was then cooled to rt and the reaction mixture was extracted with EtOAc. The crude product was adsorbed onto Celite and purified via flash chromatography (EtOAc/Heptanes, 1:99 to 1:49) and then via reverse phase chromatography (MeCN/ H_2O , 90:10 to 92/8 to 95/5) to provide 2-(4-(tert-butyl)naphthalen-2-yl)-4,5-dimethylquinoline as a white solid (3.50 g, 71%).

Synthesis of Iridium(III) Dimer

[0174]

2-(4-(tert-butyl)naphthalen-2-yl)-4,5-dimethylquinoline (3.52 g, 10.36 mmol) was dissolved in 2-ethoxyethanol (42.0 mL) and water (14.0 mL) and the mixture was degassed with N_2 for 15 mins. Iridium(III) chloride tetrahydrate (1.28 g, 3.45 mmol) was then added and the reaction mixture was heated to $105^\circ C.$, under N_2 , for 16 h. After this time, the reaction flask was cooled to rt. The reaction mixture was diluted with MeOH and filtered to obtain dark brown precipitate, which was dried using a vacuum oven (1.94 g, 62%).

Synthesis of Compound 3393 $[Ir(L_{A17})_2(L_{B5})]$

[0175]

A solution of Iridium(III) dimer (1.00 g, 0.55 mmol) and 3,7-diethylnonane-4,6-dione (1.30 mL, 5.53 mmol) in 2-ethoxyethanol (18 mL) was degassed with N_2 for 15 min. K_2CO_3 (0.76 g, 5.53 mmol) was next added and the reaction mixture was left to stir at rt, under N_2 , for 21 h. After this time, the reaction mixture was filtered through a plug of Celite, eluting first with MeOH followed by CH_2Cl_2 using a separate filter flask. The filtrate collected was then concentrated in vacuo. The crude product was adsorbed onto Celite and purified via flash chromatography (pretreated with Heptanes/triethylamine, 9:1) using CH_2Cl_2 /Heptanes (1:99 to 1:49 to 1:9) to provide Compound 3393 [$Ir(L_{A17})_2(L_{B5})$] as a red solid (0.35 g, 29%).

Synthesis of Compound 3899 [$Ir(L_{A523})_2(L_{B5})$]

Synthesis of 4-(4-(tert-butyl)naphthalen-2-yl)-7-isopropylthieno[3,2-d]pyrimidine

[0176]

4-chloro-7-isopropylthieno[3,2-d]pyrimidine (2.10 g, 9.87 mmol), 2-(4-(tert-butyl)naphthalen-2-yl)-4,4,5,5-tetraethyl-1,3,2-dioxaborolane (3.22 g, 10.4 mmol), K_2CO_3 (3.41 g, 24.7 mmol), DME (53 mL) and H_2O (18 mL) were combined in a flask. The reaction mixture was purged with N_2 for 15 min followed by the addition $Pd(PPh_3)_4$ (0.57 g, 0.49 mmol). The reaction mixture was then heated to $75^\circ C$, under N_2 , overnight. Upon completion of the reaction, the reaction flask was cooled to rt and the reaction mixture was extracted with EtOAc. The crude product was purified via flash chromatography Heptanes/EtOAc (9:1 to 4:1) to provide 4-(4-(tert-butyl)naphthalen-2-yl)-7-isopropylthieno[3,2-d]pyrimidine (3.26 g, 92% yield).

[0177] Synthesis of the Iridium(III) Dimer

4-(4-(tert-butyl)naphthalen-2-yl)-7-isopropylthieno[3,2-d]pyrimidine (3.16 g, 8.77 mmol) was dissolved in 2-ethoxyethanol (37 mL) and water (12 mL) and the mixture was degassed with N_2 for 15 mins. Iridium(III) chloride tetrahydrate (1.00 g, 2.70 mmol) was then added and the reaction mixture was heated to $105^\circ C$, under N_2 , overnight. After this time, the reaction flask was cooled to rt. The reaction

mixture was diluted with MeOH and filtered to obtain green precipitate, which was dried using a vacuum oven (quantitative).

Synthesis of Compound 3899 [Ir(L_{A523})₂(L_{B5})]

[0178]

A solution of Iridium(III) dimer (1.50 g, 0.79 mmol) and 3,7-diethylnonane-4,6-dione (1.26 g, 5.94 mmol) in 2-ethoxyethanol (26 mL) was degassed with N₂ for 15 min. K₂CO₃ (0.82 g, 5.94 mmol) was next added and the reaction mixture was left to stir at rt, under N₂, overnight. After this time, the reaction mixture was filtered through a plug of Celite, eluting first with MeOH followed by CH₂Cl₂ using a separate filter flask. The filtrate collected was then concentrated in vacuo. The crude product was purified via flash chromatography (pretreated with Heptanes/triethylamine, 9:1) using CH₂Cl₂/Heptanes (1:4) to provide Compound 3899 [Ir(L_{A783})₂(L_{B5})] as a red solid (0.70 g, 79%).

Synthesis of Compound 5975 [Ir(L_{A783})₂(L_{B5})]

Synthesis of 3-Fluoronaphthalen-2-ol

[0179]

(Bromodifluoromethyl)trimethylsilane (35.3 ml, 227 mmol) was added to a solution of 1,3-dihydro-2H-inden-2-one (20 g, 151 mmol) and tetrabutylammonium bromide (4.88 g, 15.13 mmol) in toluene (500 ml). The reaction was heated to 100° C. and stirred for 2.5 hrs. (Bromodifluoromethyl)trimethylsilane (35.3 ml, 227 mmol) was added and the reaction stirred for a further 3 hrs at 100° C. The reaction was allowed to cool to r.t. and tetra-n-butylammonium fluoride (1M in THF) (30.3 ml, 30.3 mmol) was added. The reaction was allowed to stir at r.t. for ~18 h. The reaction was poured onto 1N HCl (aq) and was extracted with EtOAc, 1N NaOH (aq) was added to the organic phase and the layers separated. The aqueous phase was acidified by the addition of 1N HCl and reextracted with EtOAc. The organic phase was washed with brine, dried (MgSO₄) and concentrated under reduced pressure. The crude product was purified via flash chromatography (isohexane to 20% EtOAc in isohexane) to give 3-fluoronaphthalen-2-ol (8.9 g, 54.9 mmol, 36% yield).

Synthesis of 3-Fluoronaphthalen-2-yl trifluoromethanesulfonate

[0180]

Tf₂O (11.1 ml, 65.9 mmol) was added to a solution of 3-fluoronaphthalen-2-ol (8.90 g, 54.9 mmol) and Et₃N (9.2 ml, 65.9 mmol) in DCM (200 ml) at 0° C. The reaction was stirred at this temperature for 1.5 h. The reaction was quenched via the addition of sat aq. NaHCO₃ and the mixture extracted with DCM (x2). The combined organic extracts were dried (MgSO₄) and concentrated under reduced pressure. The crude product was purified via flash chromatography (isohexane to 10% EtOAc in isohexane) to give 3-fluoronaphthalen-2-yl trifluoromethanesulfonate (13.3 g, 82% yield) as a colourless oil.

Synthesis of 2-(3-Fluoro-naphthalen-2-yl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane

[0181]

-continued

$\text{PdCl}_2(\text{dppf})\text{-CH}_2\text{Cl}_2$ adduct (2.50 g, 3.06 mmol) was added to a degassed solution of 3-fluoronaphthalen-2-yl trifluoromethanesulfonate (18 g, 61.2 mmol), bis(pinacolato)diboron (46.6 g, 184 mmol) and potassium acetate (18 g, 184 mmol) in dioxane (200 ml). The reaction was heated to reflux for 2 h and was then allowed to cool to r.t. The reaction was partitioned between EtOAc and water and the layers separated. The organic phase was dried (MgSO_4) and concentrated under reduced pressure to give the crude material. The crude material was filtered through a pad of silica, washing with DCM. The filtrate was concentrated under reduced pressure to give a mixture of 2-(3-fluoronaphthalen-2-yl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane and bis(pinacolato)diboron (^1H NMR evidence).

Synthesis of (3-Fluoronaphthalen-2-yl)boronic acid

[0182]

Concentrated HCl (153 ml, 1837 mmol) was added to a solution of crude 2-(3-fluoro-naphthalen-2-yl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane and bis(pinacolato)diboron mixture (50 g) in IPA (400 ml). The reaction flask was heated to reflux for ~18 h. The reaction flask was allowed to cool to r.t. and the majority of the IPA was removed under reduced pressure. The resultant precipitate was filtered. The precipitate was purified by flash chromatography (4/1 to 1/1 isohexane/EtOAc) and recrystallisation from IPA/water. The recrystallisation gave 3 batches in total. The filtrate from the first recrystallisation yielded further material on prolonged standing/slow evaporation. Similarly a third batch was obtained from this second recrystallisation. All batches were taken up in MeOH, combined and concentrated under a flow of nitrogen. Drying in the vacuum oven for 3 days gave 7.1 g of (3-fluoronaphthalen-2-yl)boronic acid/2-(1-fluoronaphthalen-2-yl)-4,6-bis(3-fluoronaphthalen-2-yl)-1,3,5,2,4,6-trioxatriborinane for a 50% yield over 2 steps.

Synthesis of 4-(3-fluoronaphthalen-2-yl)-7-isopropylthieno[3,2-d]pyrimidine

[0183]

A 250 mL RBF was charged with 4-chloro-7-isopropylthieno[3,2-d]pyrimidine (3.0 g, 14.1 mmol), (3-fluoronaphthalen-2-yl)boronic acid (2.95 g, 15.5 mmol), potassium carbonate (4.87 g, 35.3 mmol), $\text{Pd}(\text{PPh}_3)_4$ (0.49 g, 0.42 mmol), THF (53 mL), and Water (18 mL), degassed with nitrogen and heated to reflux at 70° C. overnight. The reaction mixture was cooled to room temperature and washed with brine. The organic layer was dried over sodium sulfate, filtered and concentrated. The crude product was purified by flash chromatography (EtOAc/heptanes, 1:19) providing 4-(3-fluoronaphthalen-2-yl)-7-isopropylthieno[3,2-d]pyrimidine (4.20 g, 92% yield) as a viscous oil that crystallizes slowly upon sitting. Further purification was achieved by recrystallization from MeOH.

Synthesis of the Ir(III) Dimer

[0184]

4-(3-fluoronaphthalen-2-yl)-7-isopropylthieno[3,2-d]pyrimidine (2.35 g, 8.77 mmol) was dissolved in 2-ethoxyethanol (30 mL) and water (10 mL) in a flask. The reaction was purged with nitrogen for 15 min, then iridium(III) chloride tetrahydrate (0.90 g, 2.43 mmol) was added. The reaction was heated in an oil bath set at 105° C. overnight under nitrogen. The reaction was allowed to cool, diluted with MeOH, filtered off a precipitate using MeOH, then dried in the vacuum oven for two hours to get 2.1 g of a dark red solid (98% yield). Used as is for next step.

Synthesis of Compound 5975 $[\text{Ir}(\text{L}_{A783})_2(\text{L}_{B5})]$

[0185]

The dimer (1.00 g, 0.57 mmol), 3,7-diethylnonane-4,6-dione (0.92 g, 4.31 mmol), and 2-ethoxyethanol (19 mL) were combined in a flask. The reaction was purged with nitrogen for 15 minutes then potassium carbonate (0.60 g, 4.31 mmol) was added. The reaction was stirred at room temperature overnight under nitrogen. The reaction was diluted with MeOH then filtered off the solid using celite. The precipitate was recovered using DCM. The solid was purified via flash chromatography (heptanes/DCM, 4:1 to 3:1) to afford Compound 5975 [$\text{Ir}(\text{L}_{A783})_2(\text{L}_{B5})$] (0.70 g, 58% yield) as a red solid.

Synthesis of Compound 6040 [$\text{Ir}(\text{L}_{A848})_2(\text{L}_{B5})$]

Synthesis of 7-isopropyl-4-(3-methylnaphthalen-2-yl)thieno[3,2-d]pyrimidine

[0186]

4-chloro-7-isopropylthieno[3,2-d]pyrimidine (3.0 g, 14.1 mmol), (4,4,5,5-tetramethyl-2-(3-methylnaphthalen-2-yl)-1,3,2-dioxaborolane (3.86 g, 14.4 mmol), potassium carbonate (4.87 g, 35.3 mmol), DME (75 mL), and water (25 mL) were combined in a flask. The reaction was purged with nitrogen for 15 minutes then palladium tetrakis (0.489 g, 0.423

mmol) was added. The reaction was heated to reflux in an oil bath overnight under nitrogen. The reaction mixture was extracted with EtOAc. The organic phase was washed with brine twice, dried with sodium sulfate, filtered and concentrated down to a brown solid. The brown solid was purified using flash chromatography (heptanes/EtOAc/DCM, 18:1:1 to 16:3:1) to afford 7-isopropyl-4-(3-methylnaphthalen-2-yl)thieno[3,2-d]pyrimidine (3.50 g, 78% yield) as a white solid.

Synthesis of the Ir(III) Dimer

[0187]

(2.93 g, 9.21 mmol), 2-ethoxyethanol (54 mL) and water (18 mL) were combined in a flask. The reaction was purged with nitrogen for 15 minutes, then iridium(III) chloride tetrahydrate (1.05 g, 2.83 mmol) was added. The reaction was heated in an oil bath set at 105°C overnight under nitrogen. The reaction was allowed to cool, diluted with MeOH, filtered off a precipitate using MeOH, then dried in the vacuum oven for two hours to get 2.2 g of a dark red solid (90% yield). Used as is for next step.

Synthesis of Compound 6040 $[\text{Ir}(\text{L}_{A848})_2(\text{L}_{B5})]$

[0188]

The dimer (2.20 g, 1.28 mmol), 3,7-diethylnonane-4,6-dione (2.71 ml, 12.8 mmol), and 2-ethoxyethanol (30 ml) were combined in a flask. The reaction was purged with nitrogen for 15 min then potassium carbonate (1.76 g, 12.8 mmol) was added. The reaction was stirred at room temperature over the weekend under nitrogen. The reaction was diluted with MeOH then filtered off a dark reddish brown solid using celite. The precipitate was recovered using DCM to get a red-brown solid. The solid was purified via flash chromatography, preconditioned with 75/15/10 heptanes/DCM/Et₃N then heptanes/DCM (19:1 to 17:3) to get 1.10 g of a red solid. The solid was dissolved in DCM and MeOH was added, the mixture was partially concentrated down on the rotovap at 30° C. bath temperature. The precipitate was filtered off and dried in the vacuum oven overnight to afford Compound 6040 $[\text{Ir}(\text{L}_{A848})_2(\text{L}_{B5})]$ (0.94 g, 36%) as a red solid.

Synthesis of Compound 8595 $[\text{Ir}(\text{L}_{A1323})_2(\text{L}_{B5})]$

Synthesis of 2-(4-(tert-butyl)naphthalen-2-yl)-4-chloro-5,7-dimethylquinoline

[0189]

-continued

2,4-dichloro-5,7-dimethylquinoline (6.75 g, 29.9 mmol), 2-(4-(tert-butyl)naphthalen-2-yl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (9.45 g, 30.5 mmol), potassium carbonate (10.31 g, 74.6 mmol), THF (160 ml), and water (40 ml) were combined in a flask. The solution was purged with nitrogen for 15 min then palladium tetrakis (1.04 g, 0.90 mmol) was added. A condenser was attached then the reaction was heated to reflux in an oil bath overnight. The reaction was transferred to a separatory funnel with ethyl acetate. The aqueous was partitioned off. The organic phase was washed with brine twice, dried with sodium sulfate, filtered and concentrated down to a beige solid. The solid was purified with silica gel using 84/1/15 to 74/1/25 hept EtOAc/DCM solvent system to get 6.65 g of a white solid for a 60% yield.

Synthesis of 2-(4-(tert-butyl)naphthalen-2-yl)-4,5,7-trimethylquinoline

[0190]

2-(4-(tert-butyl)naphthalen-2-yl)-4-chloro-5,7-dimethylquinoline (3.30 g, 8.83 mmol), potassium phosphate tribasic (5.62 g, 26.5 mmol), toluene (70 ml) and water (7.0 ml) were combined in a flask. The reaction was purged with nitrogen then $\text{Pd}_2(\text{dba})_3$ (0.16 g, 0.18 mmol), SPhos (0.29 g, 0.71 mmol), and 2,4,6-trimethyl-1,3,5,2,4,6-trioxatrinborinane (1.85 ml, 13.2 mmol) were added. The reaction was placed in an oil bath and heated to reflux overnight under nitrogen. The reaction was filtered through celite with EtOAc to remove the black precipitate. The filtrate was transferred to separatory funnel, washed with brine once, dried with sodium sulfate, filtered and concentrated down to an orange solid. The orange solid was purified with silica gel using 80/5/15 hept/EtOAc/DCM solvent system to get 3.05 g of a white solid for a 98% yield.

Synthesis of the Ir(III) Dimer

[0191]

2-(4-(tert-butyl)naphthalen-2-yl)-4,5,7-trimethylquinoline (2.94 g, 8.33 mmol), 2-ethoxyethanol (45 ml) and water (15 ml) were combined in a flask. The reaction was purged with nitrogen for 15 minutes, then Iridium Chloride tetrahydrate (0.95 g, 2.56 mmol) was added. The reaction was heated in an oil bath set at 105°C. overnight. The reaction was diluted with MeOH, filtered off a precipitate using MeOH, then dried the solid in the vacuum oven for two hours to get 1.20 g of a red-brown solid for a 50% yield. Used as is for next step.

Synthesis of Compound 8595 $[\text{Ir}(\text{L}_{A1323})_2(\text{L}_{B5})]$
[0192]

The Ir(III) dimer (1.20 g, 0.64 mmol), 3,7-diethylnonane-4,6-dione (1.5 ml, 6.43 mmol), and 2-ethoxyethanol (15 ml) were combined in a flask. The mixture was purged with nitrogen for 15 minutes then potassium carbonate (0.89 g, 6.43 mmol) was added. The reaction was stirred at room temperature overnight under nitrogen. The reaction was diluted with MeOH then filtered off a dark red solid. The precipitate was recovered using DCM. The sample was purified with silica gel (pretreated with Triethylamine) using 95/5 to 90/10 hept/DCM solvent system to get 0.95 g of a red solid. The solid was solubilized in DCM and MeOH was added to afford the target compound (0.68 g, 48% yield).

Synthesis of Comparative Compound 1
 Synthesis of
 4,5-dichloro-2-(3-methylnaphthalen-1-yl)quinoline
[0193]

-continued

2,4,5-trichloroquinoline (3.05 g, 13.1 mmol), 4,4,5,5-tetramethyl-2-(3-methylnaphthalen-1-yl)-1,3,2-dioxaborolane (3.87 g, 14.4 mmol), and potassium carbonate (5.44 g, 39.4 mmol) were inserted in a flask. THF (98 mL) and Water (33 mL) were then added and the reaction mixture was degassed with nitrogen gas for 15 minutes. Palladium tetrakis (0.60 g, 0.53 mmol) was added and the reaction was heated to reflux overnight. Upon completion, water was added and the mixture was extracted with Ethyl Acetate. The crude material was purified via column chromatography using a mixture of Heptanes/Ethyl Acetate/DCM (90/5/5) as the solvent system. The product was then triturated from Methanol and then from Heptanes to afford 3.30 g (74% yield) of the title compound.

Synthesis of

4,5-dimethyl-2-(3-methylnaphthalen-1-yl)quinoline

[0194]

4,5-dichloro-2-(3-methylnaphthalen-1-yl)quinoline (3.10 g, 9.17 mmol), $\text{Pd}_2(\text{dba})_3$ (0.17 g, 0.18 mmol), SPhos (0.30 g,

0.73 mmol), and potassium phosphate (5.84 g, 27.5 mmol) were inserted in a flask. Toluene (56 mL) and Water (6 mL) were added, followed by the addition of 2,4,6-trimethyl-1,3,5,2,4,6-trioxatriborinane (3.1 mL, 22.0 mmol) via syringe. The reaction mixture was degassed with nitrogen for 15 minutes and then was heated to reflux overnight. Upon completion, water was added to the mixture and it was extracted with Ethyl Acetate. The crude material was purified via column chromatography using Heptanes/Ethyl Acetate (90/10) as solvent system. The product still contained 0.45% impurity, so it was purified via column chromatography again using Heptanes/Ethyl Acetate (95/5) as solvent system. The title compound was afforded as a white solid (2.35 g, 86% yield).

Synthesis of the Ir(III) Dimer

[0195]

4,5-dimethyl-2-(3-methylnaphthalen-1-yl)quinoline (2.387 g, 8.03 mmol), 2-ethoxyethanol (39 mL) and Water (13 mL) were combined in a flask. The mixture was purged with nitrogen for 15 min, then iridium(III) chloride tetrahydrate (0.85 g, 2.29 mmol) was added and the reaction was heated at 105° C. overnight under nitrogen. The mixture was cooled down to room temperature, diluted with MeOH and filtered off the precipitate to afford 1.00 g (53% yield) of the Dimer.

Synthesis of Comparative Compound 1

[0196]

Ir(III) Dimer (1.00 g, 0.61 mmol), 3,7-diethylnonane-4,6-dione (1.44 mL, 6.09 mmol) and 2-ethoxyethanol (20 mL) were combined in a flask. The reaction was purged with nitrogen for 15 min, then potassium carbonate (0.84 g, 6.09 mmol) was added. The reaction was stirred at room temperature overnight. Methanol was added to the mixture and the precipitate was filtered off on a pad of celite. The solids on the Celite were then washed with DCM and the product was collected in a filtering flask. The collected product was solubilized in DCM and filtered on a pad of Silica. The product was then triturated in MeOH and recrystallized from DCM/EtOH to afford 0.85 g (70% yield) of the target.

of Liq (8-hydroxyquinoline lithium) doped with 40% of ETM as the ETL. The emitter was selected to provide the desired color, efficiency and lifetime. The SD compound was added to the electron-transporting host to help transport positive charge in the emissive layer. The Comparative Example device was fabricated similarly to the device examples except that Comparative Compound 1 was used as the emitter in the EML. FIG. 1 shows the schematic device structure. Table 1 shows the device layer thickness and materials. The chemical structures of the device materials are shown below.

EXPERIMENTAL

Device Examples

[0197] All example devices were fabricated by high vacuum ($<10^{-7}$ Torr) thermal evaporation. The anode electrode was 1150 Å of indium tin oxide (ITO). The cathode consisted of 10 Å of Liq (8-hydroxyquinoline lithium) followed by 1,000 Å of Al. All devices were encapsulated with a glass lid sealed with an epoxy resin in a nitrogen glove box (<1 ppm of H_2O and O_2) immediately after fabrication, and a moisture getter was incorporated inside the package. The organic stack of the device examples consisted of sequentially, from the ITO surface, 100 Å of HATCN as the hole injection layer (HIL); 450 Å of HTM as a hole transporting layer (HTL); 400 Å of an emissive layer (EML) containing Compound H as a host, a stability dopant (SD) (18%), and Comparative Compound 1 or Compounds 3393, 3899, 5975, and 6040 as the emitter (3%); and 350 Å

HATCN

[0198] The device performance data are summarized in Table 2. Comparative Compound 1 exhibited a Maximum Wavelength of emission (λ max) of 640 nm. The inventive compounds, namely Compounds 3,393; 3,899; and 5,975; were designed to be blue shifted compared to Comparative Compound 1 and to provide better external quantum efficiency (EQE). Compound 6,040 was designed to be red shifted. In order to afford better device performance, a different naphthalene regioisomer was used. We obtained a peak wavelength between 604 and 628 nm for the Inventive Compounds. On the other hand, Compound 6,040 was red shifted compared to Comparative Compound 1 with a peak wavelength at 653 nm. The Full Width at Half Maximum (FWHM) was also improved a lot with the inventive configuration wherein the Inventive Compounds showed a FWHM of 0.76 and 0.74 compared to 1.00 for the Comparative Compound 1. Compound 6,040 was slightly more broad at 1.10. Furthermore, a bulky side chain (t-butyl,

cycloalkyl, etc.) needs to be included at the 4-position or any substitution at the 3-position of the naphthyl moiety in order to lock in the desired naphthalene orientation toward the iridium of the final material. The combination of the naphthyl regioisomer combined with side chain allowed good performances for the inventive compounds. The EQE was much higher for the Inventive Compounds with relative value between 1.20 and 1.51.

[0199] It is understood that the various embodiments described herein are by way of example only, and are not intended to limit the scope of the invention. For example, many of the materials and structures described herein may be substituted with other materials and structures without deviating from the spirit of the invention. The present invention as claimed may therefore include variations from the particular examples and preferred embodiments described herein, as will be apparent to one of skill in the art. It is understood that various theories as to why the invention works are not intended to be limiting.

1. A compound comprising a ligand L_A of Formula I:

Formula I

wherein Ring B represents a five- or six-membered aromatic ring;

wherein R^3 represents from none to the maximum number of substitutions;

wherein X^1 , X^2 , X^3 , and X^4 are each independently a CR or N;

wherein (1) at least two adjacent ones of X^1 , X^2 , X^3 , and X^4 are CR and fused into a five or six-membered aromatic ring, or

(2) at least one of X^1 , X^2 , X^3 , and X^4 is nitrogen, or

(3) both (1) and (2) are true;

wherein (a) R^1 is CR¹¹R¹²R¹³ or join with R^2 to form into a ring; or

(b) R^2 is not hydrogen, or

(c) both (a) and (b) are true;

wherein R, R^1 , R^2 , R^3 , R^{11} , R^{12} , and R^{13} are each independently selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof;

wherein any two substituents among R, R^1 , R^2 , R^3 , R^{11} , R^{12} , and R^{13} are optionally joined to form into a ring;

wherein L_A is coordinated to a metal M;

wherein L_A is optionally linked with other ligands to comprise a tridentate, tetradentate, pentadentate, or hexadentate ligand; and

wherein M is optionally coordinated to other ligands.

2. The compound of claim 1, wherein M is selected from the group consisting of Ir, Rh, Re, Ru, Os, Pt, Au, and Cu.

3. The compound of claim 1, wherein M is Ir or Pt.

4. The compound of claim 1, wherein at least one of X^1 , X^2 , X^3 , and X^4 is nitrogen.

5. The compound of claim 1, wherein R^1 is tert-butyl or substituted tert-butyl.

6. The compound of claim 1, wherein R^1 and R^2 form into an aromatic ring, which can be further substituted.

7. The compound of claim 1, wherein R^2 is selected from the group consisting of deuterium, fluorine, alkyl, cycloalkyl, and combination thereof.

8. The compound of claim 1, wherein Ring B is phenyl.

9. The compound of claim 1, wherein the ligand L_A is selected from the group consisting of:

wherein R^1 , R^2 , R^4 , R^5 , R^6 , R^7 , R^9 , R^{10} , R^{11} , R^{12} , R^{13} , and R^{14} are each independently selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof;

wherein any two substituents are optionally joined to form into a ring.

10. The compound of claim 1, wherein the ligand L_A is selected from the group consisting of: L_{A1} through L_{A260} which are based on a structure of Formula II,

in which R^1 , R^2 , R^4 , and R^5 are defined as provided below:

19. An organic light emitting device (OLED) comprising:
an anode;
a cathode; and
an organic layer, disposed between the anode and the cathode, comprising a compound comprising a ligand L_A of Formula I:

Formula I

wherein Ring B represents a five- or six-membered aromatic ring;
wherein R³ represents from none to the maximum number of substitutions;
wherein X¹, X², X³, and X⁴ are each independently a CR or N;

wherein (1) at least two adjacent ones of X¹, X², X³, and X⁴ are CR and fused into a five or six-membered aromatic ring, or

(2) at least one of X¹, X², X³, and X⁴ is nitrogen, or

(3) both (1) and (2) are true;

wherein (a) R¹ is CR¹¹R¹²R¹³ or join with R² to form into a ring; or

(b) R² is not hydrogen, or

(c) both (a) and (b) are true;

wherein R, R¹, R², R³, R¹¹, R¹², and R¹³ are each independently selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alkenyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof;

wherein any two substituents among R, R¹, R², R³, R¹¹, R¹², and R¹³ are optionally joined to form into a ring;

wherein L_A is coordinated to a metal M;

wherein L_A is optionally linked with other ligands to comprise a tridentate, tetradentate, pentadentate, or hexadentate ligand; and

wherein M is optionally coordinated to other ligands.

20. The OLED of claim 19, wherein the organic layer is an emissive layer and the compound is an emissive dopant or a non-emissive dopant.

21. The OLED of claim 19, wherein the organic layer further comprises a host, wherein the host comprises a triphenylene containing benzo-fused thiophene or benzo-fused furan;

wherein any substituent in the host is an unfused substituent independently selected from the group consisting of C_nH_{2n+1}, OC_nH_{2n+1}, OAr₁, N(C_nH_{2n+1})₂, N(Ar₁) (Ar₂), CH=CH—C_nH_{2n+1}, C≡CC_nH_{2n+1}, Ar₁, Ar₁—Ar₂, and C_nH_{2n}—Ar₁, or the host has no substitution; wherein n is from 1 to 10; and

wherein Ar₁ and Ar₂ are independently selected from the group consisting of benzene, biphenyl, naphthalene, triphenylene, carbazole, and heteroaromatic analogs thereof.

22. The OLED of claim 19, wherein the organic layer further comprises a host, wherein host comprises at least one chemical group selected from the group consisting of carbazole, dibenzothiophene, dibenzofuran, dibenzoselenophene, azacarbazole, aza-dibenzothiophene, aza-dibenzofuran, and aza-dibenzoselenophene.

23. The OLED of claim 19, wherein the organic layer further comprises a host, wherein the host is selected from the group consisting of:

and combinations thereof.

24. (canceled)

25. A consumer product comprising an organic light emitting device comprising:
an anode;
a cathode; and
an organic layer, disposed between the anode and the cathode, comprising a compound comprising a ligand L_A of Formula I:

Formula I

wherein Ring B represents a five- or six-membered aromatic ring;

wherein R^3 represents from none to the maximum number of substitutions;

wherein X^1 , X^2 , X^3 , and X^4 are each independently a CR or N;

wherein (1) at least two adjacent ones of X^1 , X^2 , X^3 , and X^4 are CR and fused into a five or six-membered aromatic ring, or

(2) at least one of X^1 , X^2 , X^3 , and X^4 is nitrogen, or

(3) both (1) and (2) are true;

wherein (a) R^1 is $CR^{11}R^{12}R^{13}$ or join with R^2 to form into a ring; or

(b) R^2 is not hydrogen, or

(c) both (a) and (b) are true;

wherein R, R^1 , R^2 , R^3 , R^{11} , R^{12} , and R^{13} are each independently selected from the group consisting of hydrogen, deuterium, halogen, alkyl, cycloalkyl, heteroalkyl, arylalkyl, alkoxy, aryloxy, amino, silyl, alk-enyl, cycloalkenyl, heteroalkenyl, alkynyl, aryl, heteroaryl, acyl, carbonyl, carboxylic acid, ester, nitrile, isonitrile, sulfanyl, sulfinyl, sulfonyl, phosphino, and combinations thereof;

wherein any two substituents among R, R^1 , R^2 , R^3 , R^{11} , R^{12} , and R^{13} are optionally joined to form into a ring;

wherein L_A is coordinated to a metal M;

wherein L_A is optionally linked with other ligands to comprise a tridentate, tetradentate, pentadentate, or hexadentate ligand; and

wherein M is optionally coordinated to other ligands.

26. The consumer product of claim 25, wherein the consumer product is selected from the group consisting of flat panel displays, computer monitors, medical monitors, televisions, billboards, lights for interior or exterior illumination and/or signaling, heads-up displays, fully or partially transparent displays, flexible displays, laser printers, telephones, mobile phones, tablets, phablets, personal digital assistants (PDAs), wearable devices, laptop computers, digital cameras, camcorders, viewfinders, micro-displays, 3-D displays, virtual reality or augmented reality displays, vehicles, video walls comprising multiple displays tiled together, theater or stadium screen, and a sign.

摘要(译)

含有具有式I的配体的新型磷光金属配合物：具有苯或其它稠合杂环部分如苯并咪唑和苯并噻吩，可用作OLED中的发光体，并提高器件效率和发射的FWHM。
