(57) **ABSTRACT**

The application relates to a pestivirus, designated PMC virus, that is associated with porcine myocarditis syndrome, and the gene and protein sequences derived therefrom. The application further relates to detection methods, vaccine therapeutics, and diagnostic methods using the PMC virus or gene/protein sequences derived therefrom.

PESTIVIRUS SPECIES

FIELD OF THE INVENTION

[0001] The present invention relates to a novel pestivirus, and gene sequences derived from the same. The invention further relates to detection methods, vaccines, therapeutics, and diagnostic methods using the sequences of the present invention.

BACKGROUND ART

[0002] Pestiviruses cause highly contagious and often fatal diseases of pigs, cattle and sheep, which are characterised by damage to the respiratory and gastrointestinal tracts and immune system and can run an acute or chronic course. Infection of the reproductive system may cause embryonic and foetal death, congenital defects and the birth of persistently infected animals. Outbreaks of the diseases associated with pestivirus infections occur in many countries and can cause large economic losses.

[0003] The Pestivirus genus of the Flaviviridae comprises three structurally, antigenically and genetically closely related member species: Classical swine fever (CSF) or hog cholera (Francki et al. 1991. Flaviviridae, In the Fifth report of the International Committee on Taxonomy of Viruses, Archiv. Virol. Suppl. 2, Springer Verlag, Vienna p. 223-233); Bovine viral diarrhoea virus (BVDV) which mainly affects cattle, and Border disease virus (BDV) which mainly affects sheep (Moennig and Plagemann (1992) Adv. Virus Res. 41: 53-98; Moormann et al., (1990) Virology 177: 184-198; Becher et al. (1994) Virology 198: 542-551). Recent studies indicate that there may be several less well recognised viruses that warrant separate taxonomic classification, perhaps as separate species (Avalos-Ramirez et al (2001) Virology 286: 456-465)

[0004] The genomes of pestiviruses consist of a positive strand RNA molecule of about 12.5 kb (Renard et al. (1985) DNA 4: 429-438; Moormann and Hulst (1988) Virus Res. 11: 281-291; Becher et al. (1994) Virology 198: 542-551). However, the positive strand RNA genomes of several cytopathogenic BVDV strains may be considerably larger (Meyers et al. (1991) Virology 180: 602-616; Meyers et al. (1992) Virology 191: 368-386; Qi et al. (1992) Virology 189: 285-292).

[0005] An inherent property of viruses with a positive strand RNA genome is that their genomic RNA is infectious, i.e. after transfection of this RNA in cells that support viral replication, infectious virus is produced. As expected, the genomic (viral) RNA of pestiviruses is also infectious (Moennig and Plagemann, (1992) Adv. Virus Res. 41: 53-98).

[0006] In 2003 an outbreak of stillbirths and pre-weaning deaths of piglets occurred on two farms in New South Wales, Australia (McOrist et al, (2004) Aust Vet J. 82: 509-511). Key features of the clinical presentation and pathology findings suggested that this disease outbreak was novel and probably due to a virus. Extensive testing for known viruses and some bacteria failed to identify an aetiological agent. To avoid confusion with other important diseases in pigs, the term "porcine myocarditis syndrome" (abbreviated as "PMC") was ascribed to the disease, and the term "PMC virus" given to presumptive agent. Subsequently, the causative agent was identified as a novel pestivirus. The name Bungowannah is proposed for this new virus.

[0007] The present invention addresses a need in the art for methods of detecting and/or treating infections caused by the novel PMC virus.

SUMMARY OF THE INVENTION

[0008] The invention provides an isolated RNA nucleotide sequence corresponding to the PMC virus nucleotide sequence depicted in SEQ ID NO:1, or sequences substantially homologous to SEQ ID NO:1, or fragments thereof.

[0009] The invention also provides the isolated DNA nucleotide sequence of the PMC virus of SEQ ID NO:1, or sequences substantially homologous to SEQ ID NO:1, or fragments thereof.

[0010] The invention further provides polypeptides encoded by the above RNA and DNA nucleotide sequences and fragments thereof, and/or an isolated PMC virus amino acid sequence as shown in SEQ ID NO: 2 and fragments thereof.

[0011] In another aspect, the invention provides methods for detecting the presence of a PMC virus amino acid sequence in a sample, comprising the steps of:

[0012] a) contacting a sample suspected of containing a PMC virus amino acid sequence with an antibody that specifically binds to the PMC virus amino acid sequence under conditions which allow for the formation of reaction complexes comprising the antibody and the PMC virus amino acid sequence; and

[0013] b) detecting the formation of reaction complexes comprising the antibody and PMC virus amino acid sequence in the sample, wherein detection of the formation of reaction complexes indicates the presence of PMC virus amino acid sequence in the sample.

[0014] The invention also provides methods for detecting the presence of a PMC virus antibody in a sample, comprising the steps of:

[0015] a) contacting a sample suspected of containing a PMC virus antibody with an amino acid sequence under conditions which allow for the formation of reaction complexes comprising the PMC virus antibody and the amino acid sequence; and

[0016] b) detecting the formation of reaction complexes comprising the antibody and amino acid sequence in the sample, wherein detection of the formation of reaction complexes indicates the presence of PMC virus antibody in the sample.

[0017] Additionally, the invention provides an in vitro method for evaluating the level of PMC virus antibodies in a biological sample comprising the steps of:

[0018] a) detecting the formation of reaction complexes in a biological sample according to the method noted above; and

[0019] b) evaluating the amount of reaction complexes formed, which amount of reaction complexes corresponds to the level of PMC virus antibodies in the biological sample.

[0020] The invention also provides an in vitro method for evaluating the level of PMC virus polypeptides in a biological sample comprising the steps of:

[0021] a) detecting the formation of reaction complexes in a biological sample according to the method noted above; and

[0022] b) evaluating the amount of reaction complexes formed, which amount of reaction complexes corresponds to the level of PMC virus polypeptide in the biological sample.

[0023] The present invention further provides methods for detecting the presence or absence of PMC virus in a biological sample, which comprise the steps of:

[0024] a) bringing the biological sample into contact with a polynucleotide probe or primer comprising a PMC virus polynucleotide of the invention under suitable hybridising conditions; and

[0025] b) detecting any duplex formed between the probe or primer and nucleic acid in the sample.

[0026] The present invention also relates to a method for the detection of PMC virus nucleic acids present in a biological sample, comprising:

[0027] a) amplifying the nucleic acid with at least one primer as defined above,

[0028] b) detecting the amplified nucleic acids.

[0029] The present invention also relates to a method for the detection of PMC virus nucleic acids present in a biological sample, comprising:

[0030] a) hybridizing the nucleic acids of the biological sample at appropriate conditions with one or more probes as defined above,

[0031] b) washing under appropriate conditions, and

[0032] c) detecting the hybrids formed.

[0033] In a further aspect, the present invention provides a method for the generation of antibodies comprising the steps of:

[0034] a) providing a PMC virus polypeptide sequence to a subject; and

[0035] b) collecting the antibodies generated in the subject against the polypeptide.

[0036] In another aspect of the invention, there is provided a vaccine composition comprising a PMC virus polypeptide or fragment thereof. The invention also provides a vaccine composition comprising a PMC virus nucleotide or fragment thereof that encodes for a PMC virus polypeptide.

[0037] Pharmaceutical compositions comprising a PMC virus polypeptide that enhances the immunocompetence of the host individual and elicits specific immunity against the PMC virus are further provided by the invention.

[0038] The present invention also provides therapeutic compositions comprising polynucleotide sequences and/or antibodies prepared against the polypeptides of the invention. The present invention further provides therapeutic compositions comprising PMC virus nucleic acid sequences as well as antisense and ribozyme polynucleotide sequences hybridisable to a polynucleotide sequence encoding a PMC virus amino acid sequence according to the invention.

[0039] The present invention provides for the use of PMC virus amino acid sequences and/or antibodies according to the invention, for manufacture of a medicament for modulation of a disease associated with PMC virus. The present invention additionally provides for the use of polynucleotide sequences of the invention, as well as antisense and ribozyme polynucleotide sequences hybridisable to a polynucleotide sequence encoding a PMC virus amino acid sequence according to the invention, for manufacture of a medicament for modulation of a disease associated with PMC virus.

[0040] The present invention further provides a method of inducing a protective immune response in an animal or human against PMC virus comprising the steps of:

[0041] a) administering to said animal or human an effective amount of a composition of the invention.

[0042] The present invention also provides methods for enhancing an animal's immunocompetence and the activity of its immune effector cells against a PMC virus comprising the step of:

[0043] a) administering a composition comprising a therapeutically effective amount of a PMC virus peptide or polypeptide.

[0044] In addition, the present invention provides a live vector comprising the PMC virus and a heterologous polynucleotide.

[0045] In another aspect of the invention, there is provided a method of screening for drugs comprising the steps of:

[0046] a) contacting an agent with a PMC virus amino acid sequence or fragment thereof and

[0047] b) assaying for the presence of a complex between the agent and the PMC virus amino acid sequence or fragment.

[0048] The present invention also provides a method of screening for ligands of the proteins of the PMC virus comprising the steps of:

[0049] a) contacting a ligand with a PMC virus amino acid sequence or fragment thereof and

[0050] b) assaying for the presence of a complex between the PMC virus amino acid sequence or fragment and a ligand.

[0051] In a further aspect of the invention, a test kit may be prepared for the demonstration of the presence of PMC virus comprising:

[0052] (a) a predetermined amount of at least one labelled immunochemically reactive component obtained by the direct or indirect attachment of the present PMC virus amino acid sequence or a specific binding partner thereto, to a detectable label;

[0053] (b) other reagents; and

[0054] (c) directions for use of said kit.

[0055] Additionally, the invention provides a test kit for the demonstration of the presence of PMC virus comprising:

[0056] (a) a predetermined amount of at least one labelled antibody to the PMC virus;

[0057] (b) other reagents; and

[0058] (c) directions for use of said kit.

[0059] The invention also provides a test kit for the demonstration of the presence of PMC virus comprising:

[0060] (a) a predetermined amount of at least one labelled polypeptide derived from the PMC virus;

[0061] (b) other reagents; and

[0062] (c) directions for use of said kit.

[0063] Additionally the present invention provides a test kit prepared for the demonstration of the presence of PMC virus comprising:

[0064] (a) a predetermined amount of at least one labelled nucleic acid sequence derived from the PMC virus;

[0065] (b) other reagents; and

[0066] (c) directions for use of said kit.

[0067] The present invention also provides a recombinant expression vector comprising a PMC virus nucleic acid sequence or a part thereof as defined above, operably linked to prokaryotic, eukaryotic or viral transcription and translation control elements.

[0068] The invention further relates to the hosts (prokaryotic or eukaryotic cells) which are transformed by the above

mentioned vectors and recombinants and which are capable of expressing said RNA and/or DNA fragments.

[0069] The present invention also relates to a method for the production of a recombinant PMC virus polypeptide, comprising the steps of:

[0070] a) transforming an appropriate cellular host with a recombinant vector, in which a PMC virus polynucleotide sequence or a part thereof has been inserted under the control of appropriate regulatory elements,

[0071] b) culturing said transformed cellular host under conditions enabling the expression of said insert, and,

[0072] c) harvesting said polypeptide.

[0073] According to another embodiment the present invention provides methods for preparing a PMC virus amino acid sequence, comprising the steps of:

[0074] (a) culturing a cell containing a vector as described above under conditions that provide for expression of the PMC virus amino acid sequence; and

[0075] (b) recovering the expressed PMC virus sequence.

BRIEF DESCRIPTION OF THE DRAWINGS

[0076] FIG. **1** shows the DNA sequence of the PMC virus of the present invention;

[0077] FIG. **2** shows the protein sequence of the PMC virus of the present invention;

[0078] FIG. **3** shows a map of the location of primers used to sequence the whole virus, the dotted lines underneath are the length of the PCR products produced and sequenced;

[0079] FIG. **4** shows an ethidium bromide stained 0.8% gel of SISPA applied to DNA and RNA of adaptor PCR (run on Corbett and Eppendorf cycler machines). Arrows indicate where gel was cut to collect bands for purification and cloning (e.g. ER1=Eppendorf PCR machine, RNA preparation, gel position 1). Lane 1 Eppendorf machine RNA SISPA 10 ul of PCR product; Lane 2 Eppendorf machine DNA SISPA 10 ul of PCR product; Lane 3 Eppendorf machine RNA SISPA 40 ul of PCR product; Lane 4 Eppendorf machine DNA SISPA 40 ul of PCR product; Lane 5 Eppendorf machine Blank 40 ul of PCR control; Lane 6 Corbett machine RNA SISPA 40 ul of PCR product; Lane 7 Corbett machine DNA SISPA 40 ul of PCR product; Lane 8 Corbett machine blank 40 ul of PCR product; Lane 9 100 bp marker.

[0080] FIG. **5** shows an ethidium bromide stained 1% gel of SISPA applied to DNA and RNA simultaneously to screen colonies for inserts (e.g. ER3 1=Eppendorf PCR machine, RNA sample position 3 colony 1). DETAILED DESCRIPTION OF THE INVENTION

New Pestivirus

[0086] In accordance with this invention, a new pestivirus has been discovered that differs genetically from known pestiviruses. The new virus is characterised by the RNA sequence corresponding to that shown in SEQ ID NO: 1. The sequence has been deposited as Genbank reference EF100713.

[0087] The new virus is hereinafter generally referred to as PMC virus and the condition caused by infection with the PMC virus is PMC.

[0088] The PMC virus genome comprises a single open reading frame (ORF), encoding a number of genes. The genes encoded by the ORF of PMC correspond to those of other pestiviruses, being the Npro, capsid, E0, E1, E2, P7, NS2, NS3, NS4A, NS4B, NS5A and NS5B genes.

[0089] The PMC virus is approximately 40% similar to other pestiviruses on a nucleic acid sequence level. At the protein level, PMC virus has 46-71% identity and 63-83% similarity with other pestiviruses. A comparative analysis of both the nucleic acid and deduced amino acid sequences would suggest that PMC virus is sufficiently unique to warrant consideration for classification as a new species within the pestivirus genus.

Open Reading Frames, Encoded Genes, Features of Genome

[0090] The nucleotide sequence of SEQ ID NO:1 encodes a single ORF encoding a number of different genes. The genes encoded by SEQ ID NO:1 correspond to the Npro, capsid, E0, E1, E2, P7, NS2, NS3, NS4A, NS4B, NS5A and NS5B genes of other pestiviruses.

[0091] The approximate location of the genes of PMC, based on sequence comparison with gi12657941, is indicated in Table 1.

Nucleic Acid Sequences

RNA

[0092] The invention provides an isolated RNA nucleotide sequence corresponding to the PMC virus nucleotide sequence depicted in SEQ ID NO:1, or sequences substantially homologous to SEQ ID NO:1, or fragments thereof. The invention further provides an RNA sequence comprising the complement of the PMC virus RNA genome, or fragments thereof.

[0093] The RNA sequence may also correspond to a fragment of SEQ ID NO:1. Preferably, the fragment is selected from the following locations of SEQ ID NO:1: position 419-922, 923-1219, 1220-1885, 1886-2473, 2474-3604, 3605-3820, 3821-5224, 5225-7252, 7253-7441, 7442-8482, 8483-9997, 9998-12077. Alternatively, the fragment may be selected from any one of SEQ ID NOs:3-15.

[0094] Substantial homology or identity exists when a PMC virus polynucleotide sequence or fragment thereof will hybridise to another PMC virus polynucleotide (or a complementary strand thereof) under selective hybridisation conditions.

[0095] Selective hybridisation may be under low, moderate or high stringency conditions, but is preferably under high stringency.

[0096] Typically, selective hybridisation will occur when there is at least about 55% identity over a stretch of at least about 14 nucleotides, preferably at least about 65%, more preferably at least about 75% and most preferably at least about 90%. The length of homology comparison, as described, may be over longer stretches and in certain embodiments will often be over a stretch of at least about nine nucleotides, usually at least about 20 nucleotides, more usually at least about 24 nucleotides, typically at least about 28 nucleotides, more typically at least about 32 nucleotides and preferably at least about 36 or more nucleotides.

[0097] Thus, the polynucleotide sequences of the invention preferably have at least 75%, more preferably at least 85%, more preferably at least 90% homology to the sequences shown in the sequence listings herein. More preferably there is at least 95%, more preferably at least 98%, homology. Nucleotide homology comparisons may be conducted as described below for polypeptides. A preferred sequence comparison program is the GCG Wisconsin Bestfit program.

[0098] In the context of the present invention, a homologous sequence is taken to include a nucleotide sequence which is at least 60, 70, 80 or 90% identical, preferably at least 95 or 98% identical at the nucleic acid level over at least 20, 50, 100, 200, 300, 500 or 819 nucleotides with the corresponding nucleotide sequences set out in SEQ ID NO:1. In particular, homology should typically be considered with respect to those regions of the sequence that encode contiguous amino acid sequences known to be essential for the function of one or more of PMC virus proteins, rather than non-essential neighbouring sequences.

[0099] PMC virus polynucleotide sequence fragments of the invention will preferably be at least 15 nucleotides in length, more preferably at least 20, 30, 40, 50, 100 or 200 nucleotides in length. Generally, the shorter the length of the polynucleotide sequence, the greater the homology required to obtain selective hybridisation. Consequently, where a polynucleotide sequence of the invention consists of less than about 30 nucleotides, it is preferred that the percentage identity is greater than 75%, preferably greater than 90% or 95% compared with the polynucleotide sequences set out in the sequence listings herein. Conversely, where a polynucleotide sequence of the invention consists of, for example, greater than 50 or 100 nucleotides, the percentage identity compared with the polynucleotide sequences set out in the sequence listings herein may be lower, for example greater than 50%, preferably greater than 60 or 75%.

[0100] Nucleic acid sequences according to the present invention which are homologous to the sequences as represented by a SEQ ID NO: 1 can be characterized and isolated according to any of the techniques known in the art, such as amplification by means of sequence-specific primers, hybridization with sequence-specific probes under more or less stringent conditions, serological screening methods or via the LiPA typing system.

DNA

[0101] The DNA of the new PMC virus also is provided. The DNA sequence is preferably derived from the RNA sequences described above. Most preferably, the DNA sequence is that shown in SEQ ID NO: 1 or fragments thereof.

[0102] The invention also provides DNA fragments hybridisable with the genomic RNA of PMC. The DNA or DNA fragment sequence may be derived from the cDNA sequence of the PMC virus or fragments thereof. The DNA, cDNA or fragments thereof may be in the form of recombinant DNAs.

[0103] The DNA sequence may also be a fragment of SEQ ID NO:1. Preferably, the fragment is selected from the following locations of SEQ ID NO:1: position 419-922, 923-1219, 1220-1885, 1886-2473, 2474-3604, 3605-3820, 3821-5224, 5225-7252, 7253-7441, 7442-8482, 8483-9997, 9998-12077.

Variant Nucleic Acids

[0104] Nucleic acid sequences and fragments, which would include some deletions or mutations which would not substantially alter their ability to hybridizing with the genome of PMC virus, are also provided by the present invention. Such variants are to be considered as forming obvious equivalents of the RNA, DNA or fragments referred to above.

[0105] Other preferred variant nucleic acid sequences of the present invention include sequences which are redundant as a result of the degeneracy of the genetic code compared to any of the above-given nucleic acid sequences of the present invention. These variant nucleic acid sequences will thus encode the same amino acid sequences as the nucleic acid sequences they are derived from. Preferably, the RNAs of these variants, and the related cDNAs derived from said RNAs, are hybridisable to corresponding parts of the RNA and cDNA of PMC virus.

[0106] Also included within the present invention are sequence variants of the DNA sequence of SEQ ID NO: 1 or corresponding RNA sequence or fragments thereof, containing either deletions and/or insertions of one or more nucleotides, especially insertions or deletions of 1 or more codons.

[0107] Also included are substitutions of some non-essential nucleotides by others (including modified nucleotides and/or inosine).

[0108] Particularly preferred variant polynucleotides of the present invention also include sequences which hybridise under stringent conditions with any of the nucleic acid sequences of the present invention. Thus, sequences which show a high degree of homology (similarity) to any of the nucleic acid sequences of the invention as described above are preferred. Particularly preferred are sequences which are at least 80%, 85%, 90%, 95% or more homologous to said nucleic acid sequences of the invention. Preferably, said sequences will have less than 20%, 15%, 10%, or 5% variation of the original nucleotides of said nucleic acid sequences.

Probes and Primers

[0109] Primer and probes are further provided, which can be made starting from any RNA or DNA sequence or sequence fragment according to the invention. Preferably, such probes or primers are between about 5 to 50 nucleotides long, more preferably from about 10 to 25 nucleotides. Probes and primers of the present invention may be used in PCR, sequencing reactions, hybridisation reactions and other applications known to the skilled person.

[0110] The present invention also relates to an oligonucleotide primer comprising part of SEQ ID NO: 1, said primer being able to act as a primer for specifically amplifying the nucleic acid of the PMC virus. Preferably, the primer is a single stranded DNA oligonucleotide sequence capable of

acting as a point of initiation for synthesis of a primer extension product which is complementary to the nucleic acid strand to be copied. The specific length and sequence of the primer used will depend on the complexity of the required DNA or RNA targets, as well as on the conditions of primer use, such as temperature and ionic strength. The fact that amplification primers do not have to match exactly with corresponding template sequence to warrant proper amplification is amply documented in the literature (Kwok et al., 1990).

[0111] The amplification method used can be either polymerase chain reaction (PCR; Saiki et al., 1988), ligase chain reaction (LCR; Landgren et al., 1988; Wu & Wallace, 1989; Barany, 1991), nucleic acid sequence-based amplification (NASBA; Guatelli et al., 1990; Compton, 1991), transcription-based amplification system (TAS; Kwoh et al., 1989), strand displacement amplification (SDA; Duck, 1990; Walker et al., 1992) or amplification by means of Qβ replicase (Lizardi et al., 1988; Lomeli et al., 1989) or any other suitable method to amplify nucleic acid molecules using primer extension. During amplification, the amplified products can be conveniently labelled either using labelled primers or by incorporating labelled nucleotides. Labels may be isotopic (^{32}P, ^{35}S, etc.) or non-isotopic (biotin, digoxigenin, etc.). The amplification reaction is repeated between 20 and 70 times, advantageously between 25 and 45 times.

[0112] The present invention also relates to an oligonucleotide probe comprising part of SEQ ID NO:1, with said probe being able to act as a hybridisation probe for the PMC virus. Preferably, the probe can be used for specific detection and/or classification into types and/or subtypes of PMC virus. Preferably, the probe is a single stranded sequence-specific oligonucleotide sequence which has a sequence that is complementary to the target sequence of the PMC virus to be detected.

[0113] Those skilled in the art will recognise that the stringency of hybridisation will be affected by such conditions as salt concentration, temperature, or organic solvents, in addition to the base composition, length of the complementary strands and the number of nucleotide base mismatches between the hybridising nucleic acids. Stringent temperature conditions will generally include temperatures in excess of 30° C., typically in excess of 37° C., and preferably in excess of 45° C. Stringent salt conditions will ordinarily be less than 1000 mM, typically less than 500 mM, and preferably less than 200 mM. However, the combination of parameters is much more important than the measure of any single parameter. An example of stringent hybridisation conditions is 65° C. and 0.1×SSC (1×SSC=0.15 M NaCl, 0.015 M sodium citrate pH 7.0).

[0114] Optionally, the probe of the invention is labelled and/or attached to a solid substrate. The solid substrate can refer to any substrate to which an oligonucleotide probe can be coupled, provided that it retains its hybridization characteristics and provided that the background level of hybridization remains low. Usually the solid substrate will be a microtiter plate, a membrane (e.g. nylon or nitrocellulose) or a microsphere (bead). Prior to application to the membrane or fixation it may be convenient to modify the nucleic acid probe in order to facilitate fixation or improve the hybridization efficiency. Such modifications may encompass homopolymer tailing, coupling with different reactive groups such as aliphatic groups, NH_2 groups, SH groups, carboxylic groups, or coupling with biotin or haptens.

[0115] The probes of the invention may include also an isolated polynucleotide attached to a label or reporter molecule and may be used to isolate other polynucleotide sequences, having sequence similarity by standard methods. For techniques for preparing and labelling probes see, e.g. Sambrook et al., (1989) or Ausubel et al., (2001).

[0116] Oligonucleotides according to the present invention and used as primers or probes may also contain or consist of nucleotide analogues such as phosphorothioates (Matsukura et al., 1987), alkylphosphoriates (Miller et al., 1979) or peptide nucleic acids (Nielsen et al., 1991; Nielsen et al., 1993) or may contain interculating agents (Asseline et al., 1984). The introduction of these modifications may be advantageous in order to positively influence characteristics such as hybridization kinetics, reversibility of the hybrid-formation, biological stability of the oligonucleotide molecules, etc.

[0117] Recombinant DNAs containing fragments of the DNA sequence of PMC virus are also provided by the present invention, and may be used as, for example, probes. Preferably, the plasmid used to generate the recombinant DNA is a plasmid amplifiable in prokaryotic or eukaryotic cells and carrying said fragments. For example, using cloned DNA containing a DNA fragment of PMC virus as a molecular hybridization probe, either by marking with radionucleotides or with fluorescent reagents, PMC virus RNA may be detected directly, for example, in blood, body fluids and blood products.

Nucleic Acid Arrays

[0118] PMC virus polynucleotide sequences (preferably in the form of probes) may also be immobilised to a solid phase support for the detection of PMC virus. Alternatively the PMC virus polynucleotide sequences will form part of a library of DNA molecules that may be used to detect simultaneously a number of different genes from PMC virus. In a further alternate form of the invention, PMC virus polynucleotide sequences together with other polynucleotide sequences (such as from other bacteria or viruses) may be immobilised on a solid support in such a manner permitting identification of the presence of PMC virus and/or any of the other polynucleotide sequences bound onto the solid support.

[0119] Techniques for producing immobilised libraries of DNA molecules have been described in the art. Generally, most prior art methods describe the synthesis of single-stranded nucleic acid molecule libraries, using for example masking techniques to build up various permutations of sequences at the various discrete positions on the solid substrate. U.S. Pat. No. 5,837,832 describes an improved method for producing DNA arrays immobilised to silicon substrates based on very large scale integration technology. In particular, U.S. Pat. No. 5,837,832 describes a strategy called "tiling" to synthesize specific sets of probes at spatially defined locations on a substrate that may be used to produce the immobilised DNA libraries of the present invention. U.S. Pat. No. 5,837,832 also provides references for earlier techniques that may also be used. Thus polynucleotide sequence probes may be synthesised in situ on the surface of the substrate.

[0120] Alternatively, single-stranded molecules may be synthesised off the solid substrate and each pre-formed sequence applied to a discrete position on the solid substrate. For example, polynucleotide sequences may be printed directly onto the substrate using robotic devices equipped with either pins or pizo electric devices.

[0121] The library sequences are typically immobilised onto or in discrete regions of a solid substrate. The substrate may be porous to allow immobilisation within the substrate or substantially non-porous, in which case the library sequences are typically immobilised on the surface of the substrate. The solid substrate may be made of any material to which polypeptides can bind, either directly or indirectly. Examples of suitable solid substrates include flat glass, silicon wafers, mica, ceramics and organic polymers such as plastics, including polystyrene and polymethacrylate. It may also be possible to use semi-permeable membranes such as nitrocellulose or nylon membranes, which are widely available. The semi-permeable membranes may be mounted on a more robust solid surface such as glass. The surfaces may optionally be coated with a layer of metal, such as gold, platinum or other transition metal. A particular example of a suitable solid substrate is the commercially available BiaCore™ chip (Pharmacia Biosensors).

[0122] Preferably, the solid substrate is generally a material having a rigid or semi-rigid surface. In preferred embodiments, at least one surface of the substrate will be substantially flat, although in some embodiments it may be desirable to physically separate regions for different polymers with, for example, raised regions or etched trenches. It is also preferred that the solid substrate is suitable for the high density application of DNA sequences in discrete areas of typically from 50 to 100 μm, giving a density of 10000 to 40000 dots/cm^{-2}.

[0123] The solid substrate is conveniently divided up into sections. This may be achieved by techniques such as photoetching, or by the application of hydrophobic inks, for example teflon-based inks (Cel-line, USA).

[0124] Discrete positions, in which each different member of the library is located may have any convenient shape, e.g., circular, rectangular, elliptical, wedge-shaped, etc.

[0125] Attachment of the polynucleotide sequences to the substrate may be by covalent or non-covalent means. The polynucleotide sequences may be attached to the substrate via a layer of molecules to which the library sequences bind. For example, the polynucleotide sequences may be labelled with biotin and the substrate coated with avidin and/or streptavidin. A convenient feature of using biotinylated polynucleotide sequences is that the efficiency of coupling to the solid substrate can be determined easily. Since the polynucleotide sequences may bind only poorly to some solid substrates, it is often necessary to provide a chemical interface between the solid substrate (such as in the case of glass) and the nucleic acid sequences. Examples of suitable chemical interfaces include hexaethylene glycol. Another example is the use of polylysine coated glass, the polylysine then being chemically modified using standard procedures to introduce an affinity ligand. Other methods for attaching molecules to the surfaces of solid substrate by the use of coupling agents are known in the art, see for example WO98/49557.

[0126] Binding of complementary polynucleotide sequences to the immobilised nucleic acid library, may be determined by a variety of means such as changes in the optical characteristics of the bound polynucleotide sequence (i.e. by the use of ethidium bromide) or by the use of labelled nucleic acids, such as polypeptides labelled with fluorophores. Other detection techniques that do not require the use of labels include optical techniques such as optoacoustics, reflectometry, ellipsometry and surface plasmon resonance (see WO97/49989).

[0127] Thus, the present invention provides a solid substrate having immobilized thereon at least one polynucleotide of the present invention, preferably two or more different polynucleotide sequences of the present invention. In a preferred embodiment the solid substrate further comprises polynucleotide sequences derived from genes other than the PMC virus polynucleotide sequence.

Antisense Nucleic Acids and Ribozymes

[0128] The present invention also extends to the preparation of antisense nucleotides and ribozymes that may be used to interfere with the expression of PMC virus amino acid sequences at the translational level. This approach utilises antisense nucleic acid and ribozymes to block translation of a specific mRNA, either by masking that mRNA with an antisense nucleic acid or cleaving it with a ribozyme.

[0129] Antisense nucleic acids are DNA or RNA molecules that are complementary to at least a portion of a specific mRNA molecule [See: Weintraub, (1990) *Sci. Am.,* 262:40-46; Marcus-Sekura, (1988) *Anal. Biochem.,* 172:289-295]. In the cell, they hybridise to that mRNA, forming a double-stranded molecule. The cell does not translate an mRNA complexed in this double-stranded form. Therefore, antisense nucleic acids interfere with the expression of mRNA into protein. Oligomers of about fifteen nucleotides and molecules that hybridise to the AUG initiation codon will be particularly efficient, since they are easy to synthesize and are likely to pose fewer problems than larger molecules when introducing them into infected cells. Antisense methods have been used to inhibit the expression of many genes in vitro [Hambor et al., (1988) *J. Exp. Med.,* 168:1237-1245].

[0130] Ribozymes are RNA molecules possessing the ability to specifically cleave other single-stranded RNA molecules in a manner somewhat analogous to DNA restriction endonucleases. Ribozymes were discovered from the observation that certain mRNAs have the ability to excise their own introns. By modifying the nucleotide sequence of these RNAs, researchers have been able to engineer molecules that recognise specific nucleotide sequences in an RNA molecule and cleave it [Cech, (1988) *J. Am. Med. Assoc.,* 260:3030-3034]. Because they are sequence-specific, only mRNAs with particular sequences are inactivated. Investigators have identified two types of ribozymes, *Tetrahymena*-type and "hammerhead"-type. *Tetrahymena*-type ribozymes recognize four-base sequences, while "hammerhead"-type recognize eleven- to eighteen-base sequences. The longer the recognition sequence, the more likely it is to occur exclusively in the target mRNA species. Therefore, hammerhead-type ribozymes are preferable to *Tetrahymena*-type ribozymes for inactivating a specific mRNA species and eighteen base recognition sequences are preferable to shorter recognition sequences.

[0131] The PMC polynucleotide sequences described herein may thus be used to prepare antisense molecules against, and ribozymes that cleave, mRNAs for PMC virus amino acid sequences, thus inhibiting expression of the PMC virus polynucleotide sequences.

Polypeptide Sequences

Polypeptides

[0132] The invention also covers polypeptides encoded by the above RNA and DNA nucleotide sequences and fragments thereof. The invention further provides an isolated

PMC virus amino acid sequence as shown in SEQ ID NO: 2 and fragments thereof. More desirably, the PMC virus amino acid sequence is provided in substantially purified form. Further provided are polypeptide fragments having lower molecular weights and having peptide sequences or fragments in common with those shown in SEQ ID NO:2.

[0133] The term "isolated" is used to describe a PMC virus amino acid sequence that has been separated from components that accompany it in its natural state. Further, a PMC virus amino acid sequence is "substantially purified" when at least about 60 to 75% of a sample exhibits a single PMC virus amino acid sequence. A substantially purified PMC virus amino acid sequence will typically comprise about 60 to 90% W/W of a PMC virus amino acid sequence sample, more usually about 95%, and preferably will be over about 99% pure. Protein purity or homogeneity may be indicated by a number of means well known in the art, such as polyacrylamide gel electrophoresis of a protein sample, followed by visualizing a single PMC virus amino acid sequence band upon staining the gel. For certain purposes, higher resolution may be provided by using HPLC or other means well known in the art which are utilised for application.

[0134] The invention further contemplates fragments of the PMC virus amino acid sequence. A PMC virus amino acid sequence fragment is a stretch of amino acid residues of at least about five to seven contiguous amino acids, often at least about seven to nine contiguous amino acids, typically at least about nine to 13 contiguous amino acids and, most preferably, at least about 20 to 30 or more contiguous amino acids.

[0135] In a highly preferred form of the invention the fragments exhibit ligand-binding, immunological activity and/or other biological activities characteristic of PMC virus amino acid sequences. More preferably, the fragments possess immunological epitopes consistent with those present on native PMC virus amino acid sequences.

[0136] As used herein, "epitope" refers to an antigenic determinant of a polypeptide. An epitope could comprise three amino acids in a spatial conformation that is unique to the epitope. Generally, an epitope consists of at least five amino acids, and more usually consists of at least 8-10 amino acids. Methods of determining the spatial conformation of such amino acids are known in the art.

[0137] Preferred PMC virus amino acid sequences of the invention will have one or more biological properties (eg in vivo, in vitro or immunological properties) of the native full-length PMC virus amino acid sequence. Alternatively, fragments of the full-length PMC virus amino acid sequence may have one or more biological properties of one or more of the genes which the full length amino acid sequence encodes.

[0138] Preferably, the fragments of the full length PMC virus amino acid sequence SEQ ID NO:2 are chosen from the following locations in SEQ ID NO:2: 1-167, 168-267, 268-489, 490-685, 686-1062, 1063-1134, 1135-1602, 1603-2278, 2279-2341, 2342-2688, 2689-3193, 3194-3886. Alternatively, the fragment may be selected from any one of SEQ ID NOs:16-27.

[0139] Non-functional PMC virus amino acid sequences are also included within the scope of the invention since they may be useful, for example, as antagonists of PMC virus genes. The biological properties of analogues, fragments, or derivatives relative to wild type may be determined, for example, by means of biological assays.

[0140] PMC virus amino acid sequences, including analogues, fragments and derivatives, can be prepared synthetically (e.g., using the well known techniques of solid phase or solution phase peptide synthesis). Preferably, solid phase synthetic techniques are employed. Alternatively, PMC virus amino acid sequences of the invention can be prepared using well known genetic engineering techniques, as described infra.

[0141] In yet another embodiment, PMC virus amino acid sequences can be purified (e.g., by immunoaffinity purification) from a biological fluid, such as but not limited to whole blood, plasma, faeces, serum, or urine from animals, including pigs, cattle, sheep, chickens, human beings, dogs, horses, and fish.

Variant Polypeptides

[0142] PMC virus amino acid sequence analogues preferably include those having an amino acid sequence wherein one or more of the amino acids is substituted with another amino acid, which substitutions do not substantially alter the biological activity of the molecule.

[0143] In the context of the invention, an analogous sequence is taken to include a PMC virus amino acid sequence which is at least 60, 70, 80 or 90% homologous, preferably at least 95 or 98% homologous at the amino acid level over at least 20, 50, 100 or 200 amino acids, with the amino acid sequence set out in SEQ ID NO:1. In particular, homology should typically be considered with respect to those regions of the sequence known to be essential for the function of the protein or proteins encoded by the PMC virus RNA, rather than non-essential neighbouring sequences.

[0144] Although homology can be considered in terms of similarity (i.e. amino acid residues having similar chemical properties/functions), in the context of the present invention it is preferred to express homology in terms of sequence identity. The terms "substantial homology" or "substantial identity", when referring to PMC virus amino acid sequences, indicate that the PMC virus amino acid sequence in question exhibits at least about 70% identity with an entire naturally-occurring PMC amino acid sequence or portion thereof, usually at least about 80% identity and preferably at least about 90 or 95% identity.

[0145] In a highly preferred form of the invention, a PMC virus amino acid sequence analogue will have 80% or greater amino acid sequence identity to the PMC virus amino acid sequence set out in SEQ ID NO:2. Examples of PMC virus amino acid sequence analogues within the scope of the invention include the amino acid sequence of SEQ ID NO:2 wherein: (a) one or more aspartic acid residues is substituted with glutamic acid; (b) one or more isoleucine residues is substituted with leucine; (c) one or more glycine or valine residues is substituted with alanine; (d) one or more arginine residues is substituted with histidine; or (e) one or more tyrosine or phenylalanine residues is substituted with tryptophan.

[0146] PMC virus amino acid sequence derivatives are also provided by the invention and include PMC virus amino acid sequences, analogues or fragments thereof which are substantially homologous in primary structure but which include chemical and/or biochemical modifications or unusual amino acids. Such modifications include, for example, acetylation, carboxylation, phosphorylation, glycosylation, ubiquitination, labelling, (e.g., with radionucleotides), and various enzymatic modifications, as will be readily appreciated by those well skilled in the art.

[0147] In one form of the invention the chemical moieties suitable for derivatisation are selected from among water soluble polymers. The polymer selected should be water soluble so that the protein to which it is attached does not precipitate in an aqueous environment, such as a physiological environment. Preferably, for therapeutic use of the end-product preparation, the polymer will be pharmaceutically acceptable. One skilled in the art will be able to select the desired polymer based on considerations such as whether the polymer/protein conjugate will be used therapeutically, and if so, the desired dosage, circulation time, resistance to proteolysis and other considerations. For the present proteins and peptides, these may be ascertained using the assays provided herein.

[0148] The water soluble polymer may be selected from the group consisting of, for example, polyethylene glycol, copolymers of ethylene glycol/propylene glycol, carboxymethylcellulose, dextran, polyvinyl alcohol, polyvinyl pyrrolidone, poly-1,3-dioxolane, poly-1,3,6-trioxane, ethylene/maleic anhydride copolymer, polyaminoacids (either homopolymers or random copolymers), and dextran or poly (n-vinyl pyrrolidone)polyethylene glycol, propropylene glycol homopolymers, polypropylene oxide/ethylene oxide copolymers, polyoxyethylated polyols and polyvinyl alcohol. Polyethylene glycol propionaldehyde may provide advantages in manufacturing due to its stability in water.

[0149] In another form of the invention the amino acid sequences may be modified to produce a longer half life in an animal host, for example, by fusing one or more antibody fragments (such as an Fc fragment) to the amino or carboxyl end of a PMC virus amino acid sequence.

[0150] Where the PMC virus amino acid sequence is to be provided in a labelled form, a variety of methods for labelling amino acid sequences are well known in the art and include radioactive isotopes such as ^{32}P, ligands which bind to labelled antiligands (eg, antibodies), fluorophores, chemiluminescent agents, enzymes and antiligands which can serve as specific binding pair members for a labelled ligand. The choice of label depends on the sensitivity required, stability requirements, and available instrumentation. Methods of labelling amino acid sequences are well known in the art [See, e.g., Sambrook et al., *Molecular Cloning: A Laboratory Manual*, Second Edition, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y. (1989); and Ausubel, F., Brent, R., Kingston, R. E., Moore, D. D., Seidman, J. G., Smith, J. A., Struhl, K. *Current protocols in molecular biology*. Greene Publishing Associates/Wiley Intersciences, New York (2001)].

[0151] The PMC virus amino acid sequences of the invention, if soluble, may be coupled to a solid-phase support, e.g., nitrocellulose, nylon, column packing materials (e.g., Sepharose beads), magnetic beads, glass wool, plastic, metal, polymer gels, cells, or other substrates. Such supports may take the form, for example, of beads, wells, dipsticks, or membranes.

[0152] The invention also provides for fusion polypeptides, comprising PMC virus amino acid sequences and fragments. Thus PMC virus amino acid sequences may be fusions between two or more PMC virus amino acid sequences or between a PMC virus amino acid sequence and a related protein. Likewise, heterologous fusions may be constructed which would exhibit a combination of properties or activities of the derivative proteins. For example, ligand-binding or other domains may be "swapped" between different fusion polypeptides or fragments. Such homologous or heterologous fusion polypeptides may display, for example, altered strength or specificity of binding. Fusion partners include immunoglobulins, bacterial beta-galactosidase, trpE, protein A, beta-lactamase, alpha amylase, alcohol dehydrogenase and yeast alpha mating factor.

[0153] Modified PMC virus amino acid sequences may be synthesised using conventional techniques, or may be encoded by a modified polynucleotide sequence and produced using recombinant nucleic acid methods. The modified polynucleotide sequence may also be prepared by conventional techniques. Fusion proteins will typically be made by either recombinant nucleic acid methods or may be chemically synthesised.

Diagnostics

[0154] In accordance with another embodiment the invention provides diagnostic and prognostic methods to detect the presence of PMC virus using PMC virus glycoproteins, proteins and other peptides and polypeptides (whether obtained in a purified state from PMC virus preparations, or by chemical synthesis) and/or antibodies derived there from and/or PMC virus polynucleotide sequences.

[0155] Diagnostic and prognostic methods will generally be conducted using a biological sample obtained from an animal, such as a pig. A "sample" refers to a sample of tissue or fluid suspected of containing a PMC polynucleotide or polypeptide from an animal, but not limited to, e.g., whole blood, blood cells, plasma, serum, milk, faecal samples, tissue and samples of in vitro cell culture constituents.

Polypeptide/Antibody-Based Diagnostics

[0156] Means are provided for the detection of proteins of PMC virus, particularly for the diagnosis of PMC or for the detection of antibodies against PMC virus or its proteins, particularly in subjects afflicted with PMC or more generally in asymtomatic carriers and in animal derived products such as meat. Such methods are also referred to as immunoassays.

[0157] The invention thus provides a method for detecting the presence of a PMC virus amino acid sequence in a sample, comprising the steps of:

[0158] a) contacting a sample suspected of containing a PMC virus amino acid sequence with an antibody that specifically binds to the PMC virus amino acid sequence under conditions which allow for the formation of reaction complexes comprising the antibody and the PMC virus amino acid sequence; and

[0159] b) detecting the formation of reaction complexes comprising the antibody and PMC virus amino acid sequence in the sample, wherein detection of the formation of reaction complexes indicates the presence of PMC virus amino acid sequence in the sample.

[0160] Particularly the invention relates to an in vitro process of diagnosis making use of an amino acid sequence encoding an envelope glycoprotein or of a polypeptide bearing an epitope of a glycoprotein from PMC virus or any other viral protein (structural or non-structural) for the detection of anti-PMC virus antibodies in serum, milk or body fluids. Preferably, the antibody used in the above methods binds to the E0, E1, E2, NS2, NS3, NS4A, NS4B and/or NS5A, NS5B proteins of PMC virus.

[0161] The invention also provides a method for detecting the presence of a PMC virus antibody in a sample, comprising the steps of:

[0162] a) contacting a sample suspected of containing a PMC virus antibody with an amino acid sequence under conditions which allow for the formation of reaction complexes comprising the PMC virus antibody and the amino acid sequence; and

[0163] b) detecting the formation of reaction complexes comprising the antibody and amino acid sequence in the sample, wherein detection of the formation of reaction complexes indicates the presence of PMC virus antibody in the sample.

[0164] A method is also provided for the detection of anti-PMC virus antibodies, comprising the steps of:

[0165] a) depositing a predetermined amount of one or several PMC virus antigens onto a solid support such as a microplate;

[0166] b) introducing increasing dilutions of a biological fluid (e.g., blood serum or plasma, milk, cerebrospinal fluid, lymphatic fluid or other body fluids) onto the antigens and incubating;

[0167] c) washing the solid support with an appropriate buffer;

[0168] d) adding specific labelled antibodies directed against the antibodies of the subject; and

[0169] e) detecting the antigen-antibody-antibody complex formed, which is then indicative of the presence of PMC virus antibodies in the biological fluid.

[0170] Preferably, the antibody used in these methods is derived from an affinity-purified polyclonal antibody, and more preferably a mAb. In addition, it is preferable for the antibody molecules used herein be in the form of Fab, Fab', $F(ab')_2$ or F(v) portions or whole antibody molecules.

[0171] Particularly preferred methods for detecting PMC virus based on the above methods include enzyme linked immunosorbent assays, radioimmunoassays, immunoradiometric assays and immunoenzymatic assays, including sandwich assays using monoclonal and/or polyclonal antibodies.

[0172] Three such procedures that are especially useful utilise either PMC virus amino acid sequences (or fragments thereof) labelled with a detectable label, antibody Ab_1 labelled with a detectable label, or antibody Ab_2 labelled with a detectable label. The procedures may be summarized by the following equations wherein the asterisk indicates that the particle is labelled and "AA" stands for the PMC virus amino acid sequence:

$$AA^*+Ab_1=AA^*Ab_1 \quad \text{A.}$$

$$AA+Ab^*_1=AA\,Ab_1^* \quad \text{B.}$$

$$AA+Ab_1+Ab_2^*=Ab_1AA\,Ab_2^* \quad \text{C.}$$

[0173] The procedures and their application are all familiar to those skilled in the art and accordingly may be utilised within the scope of the present invention. The "competitive" or "blocking" procedure, Procedure A, is described in U.S. Pat. Nos. 3,654,090 and 3,850,752. Procedure B is representative of well-known competitive assay techniques. Procedure C, the "sandwich" procedure, is described in U.S. Pat. Nos. RE 31,006 and 4,016,043. Still other procedures are known, such as the "double antibody" or "DASP" procedure.

[0174] In each instance, the PMC virus amino acid sequences form complexes with one or more antibody(ies) or binding partners and one member of the complex is labelled with a detectable label. The fact that a complex has formed and, if desired, the amount thereof, can be determined by known methods applicable to the detection of labels.

[0175] It will be seen from the above that a characteristic property of Ab_2 is that it will react with Ab_1. This is because Ab_1, raised in one mammalian species, has been used in another species as an antigen to raise the antibody, Ab_2. For example, Ab_2 may be raised in goats using rabbit antibodies as antigens. Ab_2 therefore would be anti-rabbit antibody raised in goats. For purposes of this description and claims, Ab_1 will be referred to as a primary antibody, and Ab_2 will be referred to as a secondary or anti-Ab_1 antibody.

[0176] The labels most commonly employed for these studies are radioactive elements, enzymes, chemicals that fluoresce when exposed to ultraviolet light, and others.

[0177] A number of fluorescent materials are known and can be utilised as labels. These include, for example, fluorescein, rhodamine and auramine. A particular detecting material is anti-rabbit antibody prepared in goats and conjugated with fluorescein through an isothiocyanate.

[0178] The PMC virus amino acid sequences or their binding partners can also be labelled with a radioactive element or with an enzyme. The radioactive label can be detected by any of the currently available counting procedures. The preferred isotope may be selected from ^{3}H, ^{14}C, ^{32}P, ^{35}S, ^{36}Cl, ^{51}Cr, ^{57}Co, ^{58}Co, ^{59}Fe, ^{90}Y, ^{125}I, ^{131}I, and ^{186}Re.

[0179] Enzyme labels are likewise useful, and can be detected by any of the presently utilized colorimetric, spectrophotometric, fluorospectrophotometric, amperometric or gasometric techniques. The enzyme is conjugated to the selected particle by reaction with bridging molecules such as carbodiimides, diisocyanates, glutaraldehyde and the like. Many enzymes, which can be used in these procedures, are known and can be utilized. The preferred enzymes are peroxidase, β-glucuronidase, β-D-glucosidase, β-D-galactosidase, urease, glucose oxidase plus peroxidase and alkaline phosphatase. U.S. Pat. Nos. 3,654,090, 3,850,752 and 4,016,043 are referred to by way of example for their disclosure of alternate labelling material and methods.

[0180] In another embodiment of the invention there are provided in vitro methods for evaluating the level of PMC virus antibodies in a biological sample comprising the steps of:

[0181] a) detecting the formation of reaction complexes in a biological sample according to the method noted above; and

[0182] b) evaluating the amount of reaction complexes formed, which amount of reaction complexes corresponds to the level of PMC virus antibodies in the biological sample.

[0183] Preferably, the antibody used in the above methods binds to the E0, E1, E2, NS2, NS3, NS4A, NS4B and/or NS5A, NS5B proteins of PMC virus.

[0184] In another embodiment of the invention there are provided in vitro methods for evaluating the level of PMC virus polypeptides in a biological sample comprising the steps of:

[0185] a) detecting the formation of reaction complexes in a biological sample according to the method noted above; and

[0186] b) evaluating the amount of reaction complexes formed, which amount of reaction complexes corresponds to the level of PMC virus polypeptide in the biological sample.

[0187] Preferably, the polypeptide used in the above methods encodes the E0, E1, E2, NS2, NS3, NS4A, NS4B and/or NS5A, NS5B proteins of PMC virus.

[0188] Further there are provided in vitro methods for monitoring therapeutic treatment of a disease associated with PMC virus in an animal host comprising evaluating, as describe above, the levels of PMC virus antibodies in a series of biological samples obtained at different time points from an animal host undergoing such therapeutic treatment.

[0189] The methods for detecting polypeptides using antibodies, or immunoassays, according to the present invention may utilize antigens from the different domains of the new and unique polypeptide sequences of the present invention that maintain linear (in case of peptides) and conformational epitopes (in case of polypeptides) recognized by antibodies in the sera from subjects infected with PMC virus.

[0190] It is within the scope of the invention to use, for instance, single or specific oligomeric antigens, dimeric antigens, as well as combinations of single or specific oligomeric antigens.

[0191] The PMC virus antigens of the present invention may be employed in virtually any assay format that employs a known antigen to detect antibodies. Of course, a format that denatures the PMC virus conformational epitope should be avoided or adapted.

[0192] A common feature of all of these detection methods is that the antigen is contacted with the test specimen suspected of containing PMC virus antibodies under conditions that permit the antigen to bind to any such antibody present in the component. Such conditions will typically be physiologic temperature, pH and ionic strength, using an appropriate predetermined quantity of antigen. The incubation of the antigen with the specimen is followed by detection of immune complexes comprised of the antigen and antibodies derived from the specimen typically by using a labelled second antibody that is directed against the immunoglobulins of the test animal species.

[0193] Design of the immunoassays is subject to a great deal of variation, and many formats are known in the art. Protocols may, for example, use solid supports, or immunoprecipitation. Assays which amplify the signals from the immune complex are also known; examples of which are assays which utilize biotin and avidin or streptavidin, and enzyme-labelled and mediated immunoassays, such as ELISA assays. Furthermore, the immunoassay may be, without limitation, in a heterogeneous or in a homogeneous format, and of a standard or competitive type.

[0194] In a heterogeneous format, the polypeptide is typically bound to a solid matrix or support to facilitate separation of the sample from the polypeptide after incubation. Examples of solid supports that can be used are nitrocellulose (e.g., in membrane or microtiter well form), polyvinyl chloride (e.g., in sheets or microtiter wells), polystyrene latex (e.g., in beads or microtiter plates, polyvinylidine fluoride (known as Immunolon™), diazotized paper, nylon membranes, activated beads, and Protein A beads. For example, Dynatech Immunolon™ 1 or Immunlon™ 2 microtiter plates or 0.25 inch polystyrene beads (Precision Plastic Ball) can be used in the heterogeneous format. The solid support containing the antigenic polypeptides is typically washed after separating it from the test sample, and prior to detection of bound antibodies. Both standard and competitive formats are know in the art.

[0195] In a homogeneous format, the test sample is incubated with the combination of antigens in solution. For example, it may be under conditions that will precipitate any antigen-antibody complexes which are formed. Both standard and competitive formats for these assays are known in the art.

[0196] In a standard format, the amount of PMC virus antibodies in the antibody-antigen complexes is directly monitored. This may be accomplished by determining whether labelled anti-xenogeneic (e.g. anti-swine) antibodies which recognize an epitope on anti-PMC virus antibodies will bind due to complex formation. In a competitive format, the amount of PMC virus antibodies in the sample is deduced by monitoring the competitive effect on the binding of a known amount of labelled antibody (or other competing ligand) in the complex.

[0197] Complexes formed comprising anti-PMC virus antibody (or in the case of competitive assays, the amount of competing antibody) are detected by any of a number of known techniques, depending on the format. For example, unlabelled PMC virus antibodies in the complex may be detected using a conjugate of anti-xenogeneic Ig complexed with a label (e.g. an enzyme label).

[0198] In an immunoprecipitation or agglutination assay format, the reaction between the PMC virus antigens and the antibody forms a network that precipitates from the solution or suspension and forms a visible layer or film of precipitate. If no anti-PMC antibody is present in the test specimen, no visible precipitate is formed.

[0199] There currently exist three specific types of particle agglutination (PA) assays. These assays are used for the detection of antibodies to various antigens when coated to a support. One type of this assay is the haemagglutination assay using red blood cells (RBCs) that are sensitized by passively adsorbing antigen (or antibody) to the RBC. The addition of specific antigen antibodies present in the body component, if any, causes the RBCs coated with the purified antigen to agglutinate.

[0200] To eliminate potential non-specific reactions in the hemagglutination assay, two artificial carriers may be used instead of RBC in the PA. The most common of these are latex particles. However, gelatin particles may also be used. The assays utilizing either of these carriers are based on passive agglutination of the particles coated with purified antigens.

Nucleic Acid-Based Diagnostics

[0201] The present invention further provides methods for detecting the presence or absence of PMC virus in a biological sample, which comprise the steps of:

[0202] c) bringing the biological sample into contact with a polynucleotide probe or primer comprising a PMC virus polynucleotide of the invention under suitable hybridising conditions; and

[0203] d) detecting any duplex formed between the probe or primer and nucleic acid sequences in the sample.

[0204] According to one embodiment of the invention, detection of PMC virus may be accomplished by directly amplifying PMC virus polynucleotide sequences from biological sample, using known techniques and then detecting the presence of PMC virus polynucleotide sequences.

[0205] The present invention thus also relates to a method for the detection of PMC virus nucleic acids present in a biological sample, comprising:

[0206] c) amplifying the nucleic acid with at least one primer as defined above,

[0207] d) detecting the amplified nucleic acids.

[0208] Preferably, the nucleic acid is extracted and/or purified (eg from a from a tissue sample) prior to amplification.

[0209] The present invention also relates to a method for the detection of PMC virus nucleic acids present in a biological sample, comprising:

[0210] d) hybridizing the nucleic acids of the biological sample at appropriate conditions with one or more probes as defined above,

[0211] e) washing under appropriate conditions, and

[0212] f) detecting the hybrids formed.

[0213] Preferably, the hybridizing conditions are denatured conditions.

[0214] Preferably, the nucleic acid is extracted and/or purified (eg from a from a tissue sample) prior to hybridisation. More preferably, the nucleic acid sample is amplified with at least one primer as defined above, after extraction or at least prior to hybridisation. Preferably, said probes are attached to a solid substrate or detected in a liquid phase by photometric or fluorogenic detection or by other methods of visualisation such as by agarose gel electrophoresis.

[0215] The present invention also relates to a method as defined above, wherein said nucleic acids are labelled during or after amplification.

[0216] Suitable assay methods for purposes of the present invention to detect hybrids formed between the oligonucleotide probes and the nucleic acid sequences in a sample may comprise any of the assay formats known in the art, such as the conventional dot-blot format, sandwich hybridization or reverse hybridization. For example, the detection can be accomplished using a dot blot format, the unlabelled amplified sample being bound to a membrane, the membrane being incorporated with at least one labelled probe under suitable hybridization and wash conditions, and the presence of bound probe being monitored.

[0217] An alternative and preferred method is a "reverse" dot-blot format, in which the amplified sequence contains a label. In this format, the unlabelled oligonucleotide probes are bound to a solid support and exposed to the labelled sample under appropriate stringent hybridization and subsequent washing conditions. It is to be understood that also any other assay method which relies on the formation of a hybrid between the nucleic acids of the sample and the oligonucleotide probes according to the present invention may be used.

[0218] In one form of the invention, the target nucleic acid sequence is amplified by PCR and then detected using any of the specific methods mentioned above. Other useful diagnostic techniques for detecting the presence of PMC virus polynucleotide sequences include, but are not limited to: 1) allele-specific PCR; 2) single stranded conformation analysis; 3) denaturing gradient gel electrophoresis; 4) RNase protection assays; 5) the use of proteins which recognize nucleotide mismatches, such as the *E. coli* mutS protein; 6) allele-specific oligonucleotides; and 7) fluorescent in situ hybridisation.

[0219] In addition to the above methods, PMC virus polynucleotide sequences may be detected using conventional probe technology. When probes are used to detect the presence of the PMC virus polynucleotide sequences, the biological sample to be analysed, such as blood or serum, may be treated, if desired, to extract the nucleic acids. The sample polynucleotide sequences may be prepared in various ways to facilitate detection of the target sequence; e.g. denaturation, restriction digestion, electrophoresis or dot blotting. The targeted region of the sample polynucleotide sequence usually must be at least partially single-stranded to form hybrids with the targeting sequence of the probe. If the sequence is naturally single-stranded, denaturation will not be required. However, if the sequence is double-stranded, the sequence will probably need to be denatured. Denaturation can be carried out by various techniques known in the art.

[0220] Sample polynucleotide sequences and probes are incubated under conditions that promote stable hybrid formation of the target sequence in the probe with the putative PMC virus polynucleotide sequence in the sample. Preferably, high stringency conditions are used in order to prevent false positives.

[0221] Detection, if any, of the resulting hybrid is usually accomplished by the use of labelled probes. Alternatively, the probe may be unlabelled, but may be detectable by specific binding with a ligand that is labelled, either directly or indirectly. Suitable labels and methods for labelling probes and ligands are known in the art, and include, for example, radioactive labels which may be incorporated by known methods (e.g., nick translation, random priming or kinasing), biotin, fluorescent groups, chemiluminescent groups (e.g., dioxetanes, particularly triggered dioxetanes), enzymes, antibodies and the like. Variations of this basic scheme are known in the art, and include those variations that facilitate separation of the hybrids to be detected from extraneous materials and/or that amplify the signal from the labelled moiety.

[0222] It is also contemplated within the scope of this invention that the nucleic acid probe assays of this invention may employ a cocktail of nucleic acid probes and/or primers capable of detecting PMC virus polynucleotide sequences. Thus, in one example to detect the presence of PMC virus polynucleotide sequences in a cell sample, more than one probe complementary to PMC virus polynucleotide sequences is employed and in particular the number of different probes is alternatively 2, 3, or 5 different nucleic acid probe sequences.

[0223] Additionally, the present invention provides a method for detecting viral RNA or DNA comprising the steps of:

[0224] a) immobilizing PMC virus on a support (e.g., a nitrocellulose filter);

[0225] b) disrupting the virion; and

[0226] c) hybridizing with a probe.

[0227] Preferably, the probe is labelled. More preferably, the probe is radiolabelled or fluorescent- or enzyme-labelled. Such an approach to detection of virus has already been developed for Hepatitis B virus in peripheral blood (Scotto J. et al. Hepatology (1983), 3, 379-384).

[0228] The present invention also provides a method for rapid screening of genomic DNA derived from the tissue of subjects with PMC virus related symptoms to detect proviral PMC virus related DNA or RNA present in the tissues. Thus, the present invention also provides a method for screening the tissue of subjects comprising the steps of:

[0229] a) extracting DNA from tissue;

[0230] b) restriction enzyme cleavage of said DNA;

[0231] c) electrophoresis of the fragments; and

[0232] d) Southern blotting of genomic DNA from tissues and subsequent hybridization with labelled cloned PMC virus DNA.

[0233] Hybridization in situ can also be used.

Antigenic Polypeptide Production

[0234] Viral RNA and DNA according to the invention can be used for expressing PMC viral antigens for diagnostic purposes, as well as for the production of a vaccine against PMC virus. The methods which can be used to achieve expression of antigenic polypeptides are multifold:

a) DNA can be transfected into mammalian cells with appropriate selection markers by a variety of techniques, such as calcium phosphate precipitation, polyethylene glycol, protoplast-fusion, etc and the resultant proteins purified.

b) DNA fragments corresponding to genes can be cloned into expression vectors for *E. coli*, yeast or mammalian cells and the resultant proteins purified.

c) The provival RNA or DNA can be "shot-gunned" (fragmented) into prokaryotic expression vectors to generate fusion polypeptides. Recombinants, producing antigenically competent fusion proteins, can be identified by simply screening the recombinants with antibodies against PMC virus antigens.

[0235] Particular reference in this respect is made to those portions of the genome of PMC virus which, in the figures, are shown to belong to open reading frames and which encode the products having the polypeptide sequences shown. Preferably, the nucleic acid sequences used in the above methods encode the E0, E1, E2, NS2, NS3, NS4A, NS4B and/or NS5A, NS5B proteins of PMC. Preferably, polypeptides are provided containing sequences in common with polypeptides comprising antigenic determinants included in the proteins encoded and expressed by the PMC virus genome.

Antibodies

Antibodies to PMC Proteins

[0236] The different peptides according to this invention can also be used themselves for the production of antibodies, preferably monoclonal antibodies specific for the respective different peptides. Thus, according to the invention, PMC virus amino acid sequences produced recombinantly or by chemical synthesis and fragments or other derivatives or analogues thereof, including fusion proteins, may be used as an immunogen to generate antibodies that recognize the PMC virus amino acid sequence. Such antibodies include but are not limited to polyclonal, monoclonal, chimeric, single chain, Fab fragments and a Fab expression library.

[0237] Thus, the present invention provides a method for the generation of antibodies comprising the steps of:

[0238] a) providing a PMC virus polypeptide sequence to a subject; and

[0239] b) collecting the antibodies generated in the subject against the polypeptide.

[0240] Preferably, the polypeptide used to generate the antibody is antigenic. More preferably, the polypeptide is chosen from the list comprising the E0, E1, E2, NS2, NS3, NS4A, NS4B and/or NS5A or NS5B proteins of PMC virus. More preferably, the protein used to generate the antibody is the E0, E2, NS2 and/or NS3 proteins or a fragment or derivative thereof. For example, in a highly preferred embodiment, a composition of the invention comprises both a PMC virus E0/E2 complex and an PMC virus NS2/NS3 complex.

[0241] A molecule is "antigenic" when it is capable of specifically interacting with an antigen recognition molecule of the immune system, such as an immunoglobulin (antibody) or T cell antigen receptor. An antigenic amino acid sequence contains at least about 5, and preferably at least about 10, amino acids. An antigenic portion of a molecule can be that portion that is immunodominant for antibody or T cell receptor recognition, or it can be a portion used to generate an antibody to the molecule by conjugating the antigenic portion to a carrier molecule for immunization. A molecule that is antigenic need not be itself immunogenic, i.e., capable of eliciting an immune response without a carrier.

[0242] An "antibody" is any immunoglobulin, including antibodies and fragments thereof, that binds a specific epitope. The term encompasses polyclonal, monoclonal, and chimeric antibodies, the last mentioned described in further detail in U.S. Pat. Nos. 4,816,397 and 4,816,567, as well as antigen binding portions of antibodies, including Fab, $F(ab')_2$ and F(v) (including single chain antibodies). Accordingly, the phrase "antibody molecule" in its various grammatical forms as used herein contemplates both an intact immunoglobulin molecule and an immunologically active portion of an immunoglobulin molecule containing the antibody combining site. An "antibody combining site" is that structural portion of an antibody molecule comprised of heavy and light chain variable and hypervariable regions that specifically binds antigen.

[0243] Exemplary antibody molecules are intact immunoglobulin molecules, substantially intact immunoglobulin molecules and those portions of an immunoglobulin molecule that contain the paratope, including those portions known in the art as Fab, Fab', $F(ab')_2$ and F(v), which portions are preferred for use in the therapeutic methods described herein.

[0244] Fab and $F(ab')_2$ portions of antibody molecules are prepared by the proteolytic reaction of papain and pepsin, respectively, on substantially intact antibody molecules by methods that are well-known. See for example, U.S. Pat. No. 4,342,566 to Theofilopolous et al. Fab' antibody molecule portions are also well-known and are produced from $F(ab')_2$ portions followed by reduction with mercaptoethanol of the disulfide bonds linking the two heavy chain portions, and followed by alkylation of the resulting protein mercaptan with a reagent such as iodoacetamide. An antibody containing intact antibody molecules is preferred herein.

[0245] The phrase "monoclonal antibody" in its various grammatical forms refers to an antibody having only one species of antibody combining site capable of immunoreacting with a particular antigen. A monoclonal antibody thus typically displays a single binding affinity for any antigen with which it immunoreacts.

[0246] For the production of hybridomas secreting said monoclonal antibodies, conventional production and screening methods can be used. These monoclonal antibodies, which themselves are part of the invention, provide very useful tools for the identification and even determination of relative proportions of the different polypeptides or proteins in biological samples, particularly animals samples containing PMC virus or related viruses.

[0247] Adjuvants include, but are not limited to, complete Freund's adjuvant, incomplete Freund's adjuvant, saponin, mineral gels such as aluminium hydroxide, surface active substances such as lysolecithin, pluronic polyols, polyanions, peptides, oil or hydrocarbon emulsions, keyhole limpet hemocyanins, dinitrophenol, and potentially useful human

adjuvants such as BCG (bacille Calmette-Guerin) and *Corynebacterium parvum*. Preferably, the adjuvant is pharmaceutically acceptable.

[0248] Further examples of adjuvants which may be effective include but are not limited to: N-acetyl-muramyl-L-threonyl-D-isoglutamine (thr-MDP), N-acetyl-nor-muramyl-L-alanyl-D-isoglutamine (CGP 11637, referred to as nor-MDP), N-acetylmuramyl-L-alanyl-D-isoglutaminyl-L-alanine-2-(1'-2'-dipalmitoyl-sn-glycero-3-hydroxyphosphoryloxy)-ethylamine (CGP 19835A, referred to as MTP-PE), and RIBI, which contains three components extracted from bacteria, monophosphoryl lipid A, trehalose dimycolate and cell wall skeleton (MPL+TDM+CWS) in a 2% squalene/Tween 80 emulsion.

[0249] Additional examples of adjuvants and other agents include aluminium hydroxide, aluminium phosphate, aluminium potassium sulfate (alum), beryllium sulfate, silica, kaolin, carbon, water-in-oil emulsions, oil-in-water emulsions, muramyl dipeptide, bacterial endotoxin, lipid X, *Corynebacterium parvum* (*Propionobacterium acnes*), *Bordetella pertussis*, polyribonucleotides, sodium alginate, lanolin, lysolecithin, vitamin A, saponin, immuno stimulating complexes (ISCOMs), liposomes, levamisole, DEAE-dextran, blocked copolymers or other synthetic adjuvants. Such adjuvants are available commercially from various sources, for example, Merck Adjuvant 65 (Merck and Company, Inc., Rahway, N.J.) or Freund's Incomplete Adjuvant and Complete Adjuvant (Difco Laboratories, Detroit, Mich.).

[0250] Typically, adjuvants such as Amphigen (oil-in-water), Alhydrogel (aluminium hydroxide), or a mixture of Amphigen and Alhydrogel are used. Only aluminium hydroxide is approved for human use.

[0251] The proportion of immunogenic polypeptide and adjuvant can be varied over a broad range so long as both are present in effective amounts. For example, aluminium hydroxide can be present in an amount of about 0.5% of the vaccine mixture (Al_2O_3 basis). Conveniently, the vaccines are formulated to contain a final concentration of immunogen in the range of from 0.2 to 200 μg/ml, preferably 5 to 50 μg/ml, most preferably 15 μg/ml.

[0252] After formulation, the vaccine may be incorporated into a sterile container which is then sealed and stored at a low temperature, for example 4° C., or it may be freeze-dried. Lyophilisation permits long-term storage in a stabilised form.

[0253] The vaccines are conventionally administered parenterally, by injection, for example, either subcutaneously or intramuscularly. Additional formulations which are suitable for other modes of administration include suppositories and, in some cases, oral formulations. For suppositories, traditional binders and carriers may include, for example, polyalkylene glycols or triglycerides; such suppositories may be formed from mixtures containing the active ingredient in the range of 0.5% to 10%, preferably 1% to 2%. Oral formulations include such normally employed excipients as, for example, pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharine, cellulose, magnesium carbonate, and the like. These compositions take the form of solutions, suspensions, tablets, pills, capsules, sustained release formulations or powders and contain 10% to 95% of active ingredient, preferably 25% to 70%. Where the vaccine composition is lyophilised, the lyophilised material may be reconstituted prior to administration, e.g. as a suspension. Reconstitution is preferably effected in buffer

[0254] Capsules, tablets and pills for oral administration to a patient may be provided with an enteric coating comprising, for example, Eudragit "S", Eudragit "L", cellulose acetate, cellulose acetate phthalate or hydroxypropylmethyl cellulose.

[0255] The PMC virus polypeptides of the invention may be formulated into the vaccine as neutral or salt forms. Pharmaceutically acceptable salts include the acid addition salts (formed with free amino groups of the peptide) and which are formed with inorganic acids such as, for example, hydrochloric or phosphoric acids, or such organic acids such as acetic, oxalic, tartaric and maleic. Salts formed with the free carboxyl groups may also be derived from inorganic bases such as, for example, sodium, potassium, ammonium, calcium, or ferric hydroxides, and such organic bases as isopropylamine, trimethylamine, 2-ethylamino ethanol, histidine and procaine.

[0256] Compositions of the present invention may further comprise antigenic polypeptides that are not coupled to PMC virus polypeptides and/or biologically active molecules whose primary purpose is not to serve as an antigen but to modulate the immune response in some other aspect. Examples of biologically molecules that modulate the immune system of an animal or human subject include cytokines.

[0257] The term "cytokine" refers to any secreted polypeptide that influences the function of other cells mediating an immune response. Some examples of cytokines include, but are not limited to, interleukin-1α (IL-1α), interleukin-1β (IL-1β), interleukin-2 (IL-2), interleukin-3 (IL-3), interleukin-4 (IL-4), interleukin-5 (IL-5), interleukin-6 (IL-6), interleukin-7 (IL-7), interleukin-8 (IL-8), interleukin-9 (IL-9), interleukin-10 (IL-10), interleukin-11 (IL-11), interleukin-12 (IL-12), interferon-α (IFN-α), interferon-β (IFN-β), interferon-γ (IFN-γ), tumour necrosis factor-α (TNF-α), tumour necrosis factor-β (TNF-β), granulocyte colony stimulating factor (G-CSF), granulocyte/macrophage colony stimulating factor (GM-CSF), and transforming growth factor-β (TGF-β).

[0258] Various procedures known in the art may be used for the production of polyclonal antibodies to PMC virus amino acid sequences, or fragment, derivative or analogues thereof.

[0259] For the production of antibody, various host animals can be immunised by injection with the PMC virus amino acid sequence, or a derivative (e.g., fragment or fusion protein) thereof, including but not limited to rabbits, mice, rats, sheep, goats, etc.

[0260] In one embodiment, the PMC virus amino acid sequences or fragment thereof can be conjugated to an immunogenic carrier, e.g., bovine serum albumin (BSA) or keyhole limpet hemocyanin (KLH).

[0261] Various adjuvants may be used to increase the immunological response, depending on the host species, including but not limited to Freund's (complete and incomplete), mineral gels such as aluminum hydroxide, surface active substances such as lysolecithin, pluronic polyols, polyanions, peptides, oil emulsions, keyhole limpet hemocyanins, dinitrophenol, and potentially useful human adjuvants such as BCG (bacille Calmette-Guerin) and *Corynebacterium parvum*.

[0262] For preparation of monoclonal antibodies directed toward the PMC virus amino acid sequences, or fragments, analogues, or derivatives thereof, any technique that provides for the production of antibody molecules by continuous cell lines in culture may be used. These include but are not limited

to the hybridoma technique originally developed by Kohler et al., (1975) *Nature,* 256:495-497, the trioma technique, the human B-cell hybridoma technique [Kozbor et al., (1983) *Immunology Today,* 4:72], and the EBV-hybridoma technique to produce human monoclonal antibodies [Cole et al., (1985) in *Monoclonal Antibodies and Cancer Therapy*, pp. 77-96, Alan R. Liss, Inc.]. Immortal, antibody-producing cell lines can be created by techniques other than fusion, such as direct transformation of B lymphocytes with oncogenic DNA, or transfection with Epstein-Barr virus. See, e.g., U.S. Pat. Nos. 4,341,761; 4,399,121; 4,427,783; 4,444,887; 4,451,570; 4,466,917; 4,472,500; 4,491,632; and 4,493,890.

[0263] In an additional embodiment of the invention, monoclonal antibodies can be produced in germ-free animals. According to the invention, swine antibodies may be used and can be obtained by using swine hybridomas or by transforming B cells with PMC virus in vitro. In fact, according to the invention, techniques developed for the production of "chimeric antibodies" [Morrison et al., (1984) *J. Bacteriol.,* 159-870; Neuberger et al., (1984) *Nature,* 312:604-608; Takeda et al., (1985) *Nature,* 314:452-454] by splicing the genes from a mouse antibody molecule specific for a PMC amino acid sequence together with genes from an antibody molecule of appropriate biological activity can be used; such antibodies are within the scope of this invention. Such chimeric antibodies are preferred for use in therapy of intestinal diseases or disorders, since the antibodies are much less likely than xenogenic antibodies to induce an immune response, in particular an allergic response, themselves.

[0264] According to the invention, techniques described for the production of single chain antibodies (U.S. Pat. No. 4,946,778) can be adapted to produce PMC virus amino acid sequence-specific single chain antibodies. An additional embodiment of the invention utilises the techniques described for the construction of Fab expression libraries [Huse et al., (1989) *Science,* 246:1275-1281] to allow rapid and easy identification of monoclonal Fab fragments with the desired specificity for a PMC virus amino acid sequence, or its derivatives, or analogues.

[0265] Antibody fragments, which contain the idiotype of the antibody molecule, can be generated by known techniques. For example, such fragments include but are not limited to: the $F(ab')_2$ fragment which can be produced by pepsin digestion of the antibody molecule; the Fab' fragments which can be generated by reducing the disulfide bridges of the $F(ab')_2$ fragment, and the Fab fragments which can be generated by treating the antibody molecule with papain and a reducing agent.

Screening for Antibodies

[0266] In the production of antibodies, screening for the desired antibody can be accomplished by techniques known in the art, e.g., radioimmunoassay, ELISA, "sandwich" immunoassays, immunoradiometric assays, gel diffusion precipitin reactions, immunodiffusion assays, in situ immunoassays (using colloidal gold, enzyme or radioisotope labels, for example), Western blots, precipitation reactions, agglutination assays (e.g., gel agglutination assays, hemagglutination assays), complement fixation assays, immunofluorescence assays, protein A assays, and immunoelectrophoresis assays, etc.

[0267] In one embodiment, antibody binding is detected by detecting a label on the primary antibody. In another embodiment, the primary antibody is detected by detecting binding of a secondary antibody or reagent to the primary antibody. In a further embodiment, the secondary antibody is labelled. Many means are known in the art for detecting binding in an immunoassay and are within the scope of the present invention. For example, to select antibodies that recognise a specific epitope of a PMC virus amino acid sequence, one may assay generated hybridomas for a product that binds to a PMC virus amino acid sequence fragment containing such epitope. For selection of an antibody specific to a PMC virus amino acid sequence from a particular species of animal, one can select on the basis of positive binding with PMC virus amino acid sequence expressed by or isolated from cells of that species of animal.

Labelling Antibodies

[0268] Advantageously, the labelling of the anti-immunoglobulin antibodies is achieved by an enzyme selected from among those which are capable of hydrolysing a substrate, which substrate undergoes a modification of its radiation-absorption, at least within a predetermined band of wavelengths. The detection of the substrate, preferably comparatively with respect to a control, then provides a measurement of the likelihood of exposure of an animal to the virus, or of the effective presence, of the disease.

[0269] Thus, preferred methods of immunoenzymatic and also immunofluorescent detections, in particular according to the ELISA technique, are provided. Titrations may be determinations by immunofluorescence or direct or indirect immunoenzymatic determinations. Quantitative titrations of antibodies on the serums studied can be made.

Epitopes Bearing Fragments

[0270] Antibodies according to the present invention may be generated using polypeptide fragments (or molecules, particularly glycoproteins having the same polypeptidic backbone as the polypeptides mentioned hereinabove) bearing an epitope characteristic of a protein or glycoprotein of PMC virus. The polypeptide or molecule may further have N-terminal and C-terminal extremities respectively either free or, independently from each other, covalently bonded to amino acids other than those which are normally associated with them in the larger polypeptides or glycoproteins of the PMC virus, which last mentioned amino acids are then free or belong to another polypeptidic sequence.

Conjugation to Increases Immunogenicity

[0271] Peptide sequences of small size bearing an epitope or immunogenic determinant, (eg those which are readily generated by chemical synthesis), may require coupling or covalent conjugation to a physiologically acceptable and non-toxic carrier molecule in order to increase their in vivo immunogenic character and thus enhance the production of antibodies.

[0272] Particularly, the invention relates to antibodies generated using hybrid polypeptides containing any of the epitope bearing-polypeptides which have been defined more specifically hereinabove, recombined with other polypeptides fragments normally foreign to the PMC virus proteins, having sizes sufficient to provide increased immunogenicity to the epitope-bearing-polypeptide. The foreign polypeptide fragments are preferably immunogenically inert and/or do not interfere with the immunogenic properties of the epitope-bearing-polypeptide.

[0273] Such hybrid polypeptides, which may contain from 5 up to 150, even 250 amino acids, usually consist of the expression products of a vector which contains a nucleic acid sequence encoding said epitope-bearing-polypeptide expressible under the control of a suitable promoter or replicon in a suitable host.

[0274] Said epitope-bearing-polypeptides, particularly those whose N-terminal and C-terminal amino acids are free, may also be generated by chemical synthesis according to techniques well known in the chemistry of proteins.

[0275] Examples of carrier molecules or macromolecular supports which can be used for making the conjugates according to the invention are natural proteins, such as tetanic toxoid, ovalbumin, serum-albumins, hemocyanins, etc. Synthetic macromolecular carriers, for example polysines or poly (D-L-alanine)-poly(L-lysine), can also be used. Other types of macromolecular carriers that can be used, which generally have molecular weights higher than 20,000, are known from the literature.

[0276] The conjugates can be synthesized by known processes such as are described by Frantz and Robertson [Infection & Immunity, 33, 193-198 (1981)] and by P. E. Kauffman [pplied and Environmental Microbiology", October 1981 Vol. 42, No. 4, pp. 611-614]. For instance, the following coupling agents can be used: glutaric aldehyde, ethyl chloroformate, water-soluble carbodiimides such as (N-ethyl-N'(3-dimethylamino-propyl) carbodiimide, HCl), diisocyanates, bis-diazobenzidine, di- and trichloro-s-triazines, cyanogen bromides and benzaquinone, as well as the coupling agents mentioned in Scand. J. Immunol., 1978, vol. 8, pp. 7-23 (Avrameas, Ternynck, Guesdon).

[0277] Any coupling process can be used for bonding one or several reactive groups of the peptide, on the one hand, and one or several reactive groups of the carrier, on the other hand. Coupling is advantageously achieved between the carboxyl and amine groups carried by the peptide and the carrier in the presence of a coupling agent of the type used in protein synthesis, e.g., 1-ethyl-3-(3-dimethylaminoproyl)-carbodiimide, N-hydroxybenzotriazole, etc. Coupling between amine groups respectively borne by the peptide and the carrier can also be made with glutaraldehyde, for instance, according to the method described by Boquet et al. (1982) Molec. Immunol., 19, 1441-1549, when the carrier is haemocyanin.

[0278] The immunogenicity of epitope-bearing-peptides can also be increased by oligomerisation thereof, for example in the presence of glutaraldehyde or any other suitable coupling agent. In particular, the invention relates to the water soluble immunogenic oligomers thus obtained, comprising particularly from 2 to 10 monomer units.

Vaccines

[0279] The invention also relates to vaccine compositions whose active principle is a polypeptide or fragment thereof of the present invention i.e. the hereinabove disclosed polypeptides of PMC virus, fusion polypeptides or oligopeptides, in association with a suitable pharmaceutically or physiologically acceptable carrier. The present invention further provides immunogenic polypeptides, and more particularly protective polypeptides, for use in the preparation of vaccine compositions against PMC or related syndromes.

[0280] Thus, the present invention provides a vaccine composition comprising a PMC virus polypeptide or fragment thereof.

[0281] Preferably, the polypeptide is an antigenic polypeptide. More preferably, the vaccine further comprises a pharmaceutically acceptable carrier or diluent.

[0282] The invention also provides a vaccine composition comprising a PMC virus nucleotide or fragment thereof that encodes for a PMC virus polypeptide.

[0283] The term "vaccine" as used herein, refers to mean any composition of the invention containing PMC virus peptide or polypeptide or nucleotide sequences coding for PMC virus polypeptides having at least one antigenic determinant which, when administered to a animal, is capable of stimulating an immune response against the antigenic determinant. It will be understood that the term vaccine does not necessarily imply that the composition will provide a complete protective response. Rather a therapeutic effect will be sufficient.

[0284] The phrase "immune response" refers to any cellular process that is produced in the animal following stimulation with an antigen and is directed toward the elimination of the antigen from the animal. The immune response typically is mediated by one or more populations of cells characterized as being lymphocytic and/or phagocytic in nature.

[0285] A vaccine may generate an immune response that blocks the infectivity, either partially or fully, of an infectious agent. The administration of the vaccine of the present invention may be for either a prophylactic or therapeutic purpose. When provided prophylactically, the vaccine is provided in advance of any exposure to PMC virus or in advance of any symptom of any symptoms due to PMC virus infection. The prophylactic administration of the immunogen serves to prevent or attenuate any subsequent infection by PMC virus in a mammal or reduce the severity of infection and/or symptoms. When provided therapeutically, the vaccine is provided at (or shortly after) the onset of the infection or at the onset of any symptom of infection or disease caused by PMC virus. The therapeutic administration of the vaccine serves to attenuate the infection or disease.

[0286] The immune response generated against an introduced PMC virus peptide or polypeptide will be dictated by the amino acid constitution of the antigenic peptide or polypeptide. Such determinants may define either humoral or cell mediated antigenic regions. Without being limited to any particular mode of action, it is contemplated that the immune response generated by the PMC virus peptide or polypeptide will preferably include both humoral and cell mediated immune responses. Where a cell mediated immune response is effected it preferably leads to a T cell cascade, and more specifically by means of a cytotoxic T cell cascade.

[0287] The term "cytotoxic T cell", as used herein, refers to any T lymphocyte expressing the cell surface glycoprotein marker CD8+ that is capable of targeting and lysing a target cell which bears a major histocompatibility class I (MHC Class I) complex on its cell surface and is infected with an intracellular pathogen.

[0288] Preferably, the vaccine composition is developed to generate antibodies against the E0 and E2 envelope glycoproteins and the NS2 and NS3 non-structural proteins.

[0289] The vaccine compositions of the present invention may be used to vaccinate animals and humans against infectious diseases, preferably against PMC. The term "animal" includes: mammals such as farm animals including sheep, goats, pigs, cows, horses, llamas, household pets such as dogs and cats, and primates; birds, such as chickens, geese and ducks; fish; and reptiles such as crocodiles and alligators.

[0290] The vaccine composition according to the invention preferably contains a nucleotide sequence as described above, either as such or as a vaccine strain or in a vector or host organism, or a polypeptide as described above, in an amount effective for producing protection against a pestivirus infection. The vaccine can also be a multipurpose vaccine comprising other immunogens or nucleotides encoding these. The vaccines can furthermore contain conventional carriers, adjuvants, solubilizers, emulsifiers, preservatives etc. The vaccines according to the invention can be prepared by conventional methods.

[0291] Preferably, the active principle is a peptide containing less than 250 amino acid units, preferably less than 150, particularly from 5 to 150 amino acid residues, as deducible from the complete genome of PMC virus.

[0292] The term 'effective amount' refers to an amount of epitope-bearing polypeptide sufficient to induce an immunogenic response in the subject to which it is administered either in a single dose or as part of a series of doses. Preferably, the effective amount is sufficient to effect prophylaxis or treatment, as defined above. The exact amount necessary will vary according to the application. For vaccine applications or for the generation of polyclonal antiserum/antibodies, for example, the effective amount may vary depending on the taxonomic group or species of subject to be treated (e.g. nonhuman primate, primate, etc.), the age and general health and physical condition of the subject, the severity of the condition being treated, the capacity of the subject's immune system to synthesize antibodies, the degree of protection desired, the formulation of the vaccine, the strain of infecting PMC virus, the particular polypeptide selected and its mode of administration, and other relevant factors. It is also believed that effective amounts will be found within a relatively large, non-critical range. An appropriate effective amount can be readily determined using only routine experimentation.

[0293] By way of example, suitable dosages of the vaccine compositions are those which are effective to elicit antibodies in vivo, in the host, particularly a porcine host. Suitable doses range from 10 to 500 μg of polypeptide, protein or glycoprotein, for instance 50 to 100 μg. Other preferred ranges of proteins for prophylaxis of PMC are 0.01 to 1000 μg/dose, preferably 0.1 to 100 μg/dose. Several doses may be needed per subject in order to achieve a sufficient immune response and subsequent protection against PMC.

[0294] The immunogenic compositions are conventionally administered using standard procedures, for example, intravenously, subcutaneously, intramuscularly, intraorbitally, ophthalmically, intraventricularly, intracranially, intracapsularly, intraspinally, intracisternally, intraperitoneally, buccal, rectally, vaginally, intranasally, orally or by aerosol administration.

[0295] Preferably, the immunogenic composition is administered parenterally, typically by injection, for example, subcutaneously or intramuscularly. However, additional formulations suitable for other methods of administration include oral formulations and suppositories or prepared for pulmonary, nasal or other forms of administration. Dosage treatment may be a single dose schedule or a multiple dose schedule.

[0296] The mode of administration of the immunogenic vaccine compositions prepared in accordance with the invention will necessarily depend upon such factors as the stability of the immunogenic compositions under physiological conditions, the intensity of the immune response required etc.

[0297] The vaccine compositions of the invention may be co-administered with additional immune response enhancers or biological response modifiers including, but not limited to, the cytokines IFN-α, IFN-γ, IL-2, IL-4, IL-6, TNF, or other cytokine-affecting immune cells. In accordance with this aspect of the invention, the PMC virus peptide or polypeptide is administered in combination therapy with a therapeutically active amount of one or more of these cytokines. In addition, conventional antibiotics may be coadministered with the PMC virus peptide or polypeptide. The choice of suitable antibiotics will however be dependent upon the disease in question.

[0298] Parenteral Delivery

[0299] The compounds provided herein can be administered by any parenteral techniques such as subcutaneous, intravenous and intraperitoneal injections. Typically, such vaccines are prepared either as liquid solutions or suspensions; solid forms suitable for solution in, or suspension in, liquid prior to injection may also be prepared. The preparation may also be emulsified, or the protein encapsulated in liposomes. The active immunogenic ingredients are often mixed with excipients and carriers, which are pharmaceutically acceptable and compatible with the active ingredient. Suitable excipients are, for example, water, saline, dextrose, glycerol, ethanol, or the like and combinations thereof.

[0300] In addition, if desired, the vaccine may contain minor amounts of auxiliary substances such as wetting or emulsifying agents, pH buffering agents, and/or adjuvants which enhance the effectiveness of the vaccine.

[0301] Oral Delivery

[0302] Contemplated for use herein are oral solid dosage forms, which are described generally in Martin, Remington's Pharmaceutical Sciences, 18th Ed. (1990 Mack Publishing Co. Easton Pa. 18042) at Chapter 89, which is herein incorporated by reference. Solid dosage forms include tablets, capsules, pills, troches or lozenges, cachets or pellets. Also, liposomal or proteinoid encapsulation may be used to formulate the present compositions (as, for example, proteinoid microspheres reported in U.S. Pat. No. 4,925,673). Liposomal encapsulation may be used and the liposomes may be derivatised with various polymers (E.g., U.S. Pat. No. 5,013, 556). A description of possible solid dosage forms for the therapeutic is given by Marshall, in Modern Pharmaceutics, Chapter 10, Banker and Rhodes ed., (1979), herein incorporated by reference. In general, the formulation will include a PMC virus polypeptide or polynucleotide, and inert ingredients which allow for protection against the stomach environment, and release of the biologically active material in the intestine.

[0303] Also specifically contemplated are oral dosage forms of PMC virus polypeptides or polynucleotides. In this respect the PMC virus polypeptides or polynucleotides may be chemically modified so that oral delivery is efficacious. Generally, the chemical modification contemplated is the attachment of at least one moiety to the protein (or peptide) molecule itself, where said moiety permits (a) inhibition of proteolysis; and (b) uptake into the blood stream from the stomach or intestine. Also desired is the increase in overall stability of the protein and increase in circulation time in the body. Examples of such moieties include: polyethylene glycol, copolymers of ethylene glycol and propylene glycol, carboxymethyl cellulose, dextran, polyvinyl alcohol, polyvi-

nyl pyrrolidone and polyproline. Abuchowski et al., 1981, supra; Newmark et al., J. Appl. Biochem., 4:185-189 (1982). Other polymers that could be used are poly-1,3-dioxolane and poly-1,3,6-tioxocane. Preferred for pharmaceutical usage, as indicated above, are polyethylene glycol moieties.

[0304] For PMC virus polypeptides or polynucleotides the location of release may be the stomach, the small intestine (the duodenum, the jejunem, or the ileum), or the large intestine. One skilled in the art has available formulations that will not dissolve in the stomach, yet will release the material in the duodenum or elsewhere in the intestine. Preferably, the release will avoid the deleterious effects of the stomach environment, either by protection of the complex or by release of the biologically active material beyond the stomach environment, such as in the intestine.

[0305] To ensure full gastric resistance, a coating impermeable to at least pH 5.0 is essential. Examples of the more common inert ingredients that are used as enteric coatings are cellulose acetate trimellitate (CAT), hydroxypropylmethylcellulose phthalate (HPMCP), HPMCP 50, HPMCP 55, polyvinyl acetate phthalate (PVAP), Eudragit L30D, Aquateric, cellulose acetate phthalate (CAP), Eudragit L, Eudragit S, and Shellac. These coatings may be used as mixed films.

[0306] A coating or mixture of coatings can also be used on tablets, which are not intended for protection against the stomach. This can include sugar coatings, or coatings which make the tablet easier to swallow. Capsules may consist of a hard shell (such as gelatin) for delivery of dry therapeutic i.e. powder; for liquid forms, a soft gelatin shell may be used. The shell material of cachets could be thick starch or other edible paper. For pills, lozenges, molded tablets or tablet triturates, moist massing techniques can be used.

[0307] The therapeutic can be included in the formulation as fine multiparticulates in the form of granules or pellets of particle size about 1 mm. The formulation of the material for capsule administration could also be as a powder, lightly compressed plugs or even as tablets. The therapeutic could be prepared by compression.

[0308] Colorants and flavoring agents may all be included. For example, PMC virus polypeptides or polynucleotides may be formulated (such as by liposome or microsphere encapsulation) and then further contained within an edible product, such as a refrigerated beverage containing colorants and flavoring agents.

[0309] One may dilute or increase the volume of the therapeutic with an inert material. These diluents could include carbohydrates, especially mannitol, alpha-lactose, anhydrous lactose, cellulose, sucrose, modified dextrans and starch. Certain inorganic salts may be also be used as fillers including calcium triphosphate, magnesium carbonate and sodium chloride. Some commercially available diluents are Fast-Flo, Emdex, STA-Rx 1500, Emcompress and Avicell.

[0310] Disintegrants may be included in the formulation of the therapeutic into a solid dosage form. Materials used as disintegrants include but are not limited to starch including the commercial disintegrant based on starch, Explotab. Sodium starch glycolate, Amberlite, sodium carboxymethylcellulose, ultramylopectin, sodium alginate, gelatin, orange peel, acid carboxymethyl cellulose, natural sponge and bentonite may all be used. Another form of the disintegrants are the insoluble cationic exchange resins. Powdered gums may be used as disintegrants and as binders and these can include powdered gums such as agar, Karaya or tragacanth. Alginic acid and its sodium salt are also useful as disintegrants.

[0311] Binders may be used to hold the therapeutic agent together to form a hard tablet and include materials from natural products such as acacia, tragacanth, starch and gelatin. Others include methyl cellulose (MC), ethyl cellulose (EC) and carboxymethyl cellulose (CMC). Polyvinyl pyrrolidone (PVP) and hydroxypropylmethyl cellulose (HPMC) could both be used in alcoholic solutions to granulate the therapeutic.

[0312] An antifrictional agent may be included in the formulation of the therapeutic to prevent sticking during the formulation process. Lubricants may be used as a layer between the therapeutic and the die wall and these can include but are not limited to: stearic acid including its magnesium and calcium salts, polytetrafluoroethylene (PTFE), liquid paraffin, vegetable oils and waxes. Soluble lubricants may also be used such as sodium lauryl sulphate, magnesium lauryl sulphate, polyethylene glycol of various molecular weights, and Carbowax 4000 and 6000.

[0313] Glidants that might improve the flow properties of the complex during formulation and to aid rearrangement during compression might be added. The glidants may include starch, talc, pyrogenic silica and hydrated silicoaluminate.

[0314] To aid dissolution of the therapeutic into the aqueous environment, a surfactant might be added as a wetting agent. Surfactants may include anionic detergents such as sodium lauryl sulphate, dioctyl sodium sulphosuccinate and dioctyl sodium sulfonate. Cationic detergents might be used and could include benzalkonium chloride or benzethomium chloride. The list of potential nonionic detergents that could be included in the formulation as surfactants are lauromacrogol 400, polyoxyl 40 stearate, polyoxyethylene hydrogenated castor oil 10, 50 and 60, glycerol monostearate, polysorbate 40, 60, 65 and 80, sucrose fatty acid ester, methyl cellulose and carboxymethyl cellulose. These surfactants could be present in the formulation of the complex either alone or as a mixture in different ratios.

[0315] Additives which potentially enhance uptake of the complex are for instance the fatty acids oleic acid, linoleic acid and linolenic acid.

[0316] Controlled release formulation may be desirable. The complex could be incorporated into an inert matrix which permits release by either diffusion or leaching mechanisms i.e., gums. Slowly degenerating matrices may also be incorporated into the formulation. Another form of a controlled release of this therapeutic is by a method based on the Oros therapeutic system (Alza Corp.), i.e. the drug is enclosed in a semipermeable membrane which allows water to enter and push drug out through a single small opening due to osmotic effects. Some enteric coatings also have a delayed release effect.

[0317] Other coatings may be used for the formulation. These include a variety of sugars which could be applied in a coating pan. The therapeutic agent could also be given in a film-coated tablet; the materials used in this instance are divided into 2 groups. The first are the nonenteric materials and include methyl cellulose, ethyl cellulose, hydroxyethyl cellulose, methylhydroxy-ethyl cellulose, hydroxypropyl cellulose, hydroxypropyl-methyl cellulose, sodium carboxymethyl cellulose, providone and the polyethylene glycols. The second group consists of the enteric materials that are commonly esters of phthalic acid.

[0318] A mix of materials might be used to provide the optimum film coating. Film coating may be carried out in a pan coater or in a fluidized bed or by compression coating.

[0319] Pulmonary Delivery

[0320] Also contemplated herein is pulmonary delivery of vaccine composition. The PMC virus polypeptides or polynucleotides may be delivered to the lungs of an animal while inhaling and traverses across the lung epithelial lining to the blood-stream.

[0321] Contemplated for use in the practice of this invention are a wide range of mechanical devices designed for pulmonary delivery of therapeutic products, including but not limited to nebulizers, metered-dose inhalers, and powder inhalers, all of which are familiar to those skilled in the art.

[0322] Some specific examples of commercially available devices suitable for the practice of this invention are the Ultravent nebulizer, manufactured by Mallinckrodt, Inc., St. Louis, Mo.; the Acorn II nebulizer, manufactured by Marquest Medical Products, Englewood, Colo.; the Ventolin metered dose inhaler, manufactured by Glaxo Inc., Research Triangle Park, N.C.; and the Spinhaler powder inhaler, manufactured by Fisons Corp., Bedford, Mass.

[0323] All such devices require the use of formulations suitable for the dispensing of the complex. Typically, each formulation is specific to the type of device employed and may involve the use of an appropriate propellant material, in addition to the usual diluents, adjuvants and/or carriers useful in therapy. Also, the use of liposomes, microcapsules or microspheres, inclusion complexes, or other types of carriers is contemplated. Chemically modified proteins may also be prepared in different formulations depending on the type of chemical modification or the type of device employed.

[0324] Formulations suitable for use with a nebulizer, either jet or ultrasonic, will typically comprise the complex suspended in water at a concentration of about 0.1 to 25 mg of biologically active protein per ml of solution. The formulation may also include a buffer and a simple sugar (e.g., for protein stabilization and regulation of osmotic pressure). The nebulizer formulation may also contain a surfactant, to reduce or prevent surface induced aggregation of the protein caused by atomization of the solution in forming the aerosol.

[0325] Formulations for use with a metered-dose inhaler device will generally comprise a finely divided powder containing the complex suspended in a propellant with the aid of a surfactant. The propellant may be any conventional material employed for this purpose, such as a chlorofluorocarbon, a hydrochlorofluorocarbon, a hydrofluorocarbon, or a hydrocarbon, including trichlorofluoromethane, dichlorodifluoromethane, dichlorotetrafluoroethanol, and 1,1,1,2-tetrafluoroethane, or combinations thereof. Suitable surfactants include sorbitan trioleate and soya lecithin. Oleic acid may also be useful as a surfactant.

[0326] Formulations for dispensing from a powder inhaler device will comprise a finely divided dry powder containing the complex and may also include a bulking agent, such as lactose, sorbitol, sucrose, or mannitol in amounts which facilitate dispersal of the powder from the device, e.g., 50 to 90% by weight of the formulation. The protein (or derivative) should most advantageously be prepared in particulate form with an average particle size of less than 10 microns, most preferably 0.5 to 5 microns, for most effective delivery to the distal lung.

Nasal Delivery

[0327] Nasal delivery of the vaccine comprising PMC virus polypeptides or polynucleotides is also contemplated. Nasal delivery allows the passage of the protein to the blood stream directly after administering the therapeutic product to the nose, without the necessity for deposition of the product in the lung. Formulations for nasal delivery include those with dextran or cyclodextran.

Therapeutic Compositions

Polypeptide Based Therapies

[0328] The PMC virus polypeptides according to present invention also can be used as a prophylactic or therapeutic, which may be utilised for the purpose of stimulating humoral and cell mediated responses in animals, such as swine, thereby providing protection against infection with PMC virus. Natural infection with PMC virus induces circulating antibody titres against PMC virus. Therefore, PMC virus amino acid sequence or parts thereof, have the potential to form the basis of a systemically or orally administered prophylactic or therapeutic to provide protection against PMC.

[0329] Thus, the invention provides pharmaceutical compositions comprising a PMC virus polypeptide that enhances the immunocompetence of the host individual and elicits specific immunity against pathogens, preferably PMC virus.

[0330] The therapeutic regimens and pharmaceutical compositions of the invention are described elsewhere in the specification. These compositions are believed to have the capacity to prevent the onset and progression of infectious disease such as PMC.

[0331] Preferably the compositions are combined with a pharmaceutically acceptable carrier or diluent to produce a pharmaceutical composition (which may be for human or animal use). Compositions of the invention comprising PMC virus polypeptides may also be combined with suitable components to obtain vaccine compositions. Accordingly, in one embodiment the present invention provides a PMC virus amino acid sequence or fragments thereof described herein in a therapeutically effective amount admixed with a pharmaceutically acceptable carrier, diluent, or excipient.

[0332] The phrase "therapeutically effective amount" is used herein to mean an amount sufficient to reduce by at least about 15%, preferably by at least 50%, more preferably by at least 90%, and most preferably prevent, a clinically significant deficit in the activity, function and response of the animal host. Alternatively, a therapeutically effective amount is sufficient to cause an improvement in a clinically significant condition in the animal host or to stimulate by at least about 15%, preferably by at least 50%, more preferably by at least 90%, and most preferably completely, a animal's immune system, causing it to generate an immunological memory against the antigenic determinant.

[0333] The phrase "pharmaceutically acceptable" refers to molecular entities and compositions that are physiologically tolerable and do not typically produce an allergic or similarly untoward reaction, such as gastric upset and the like, when administered to an animal. The term "carrier" refers to a diluent, adjuvant, excipient, or vehicle with which the compound is administered. Such pharmaceutical carriers can be sterile liquids, such as water and oils, including those of petroleum, animal, vegetable or synthetic origin, such as peanut oil, soybean oil, mineral oil, sesame oil and the like. Water or saline solutions and aqueous dextrose and glycerol solutions are preferably employed as carriers, particularly for injectable solutions. Suitable pharmaceutical carriers are

described in Martin, *Remington's Pharmaceutical Sciences,* 18th Ed., Mack Publishing Co., Easton, Pa., (1990).

[0334] In a more specific form of the invention there are provided pharmaceutical compositions comprising therapeutically effective amounts of PMC virus amino acid sequence or an analogue, fragment or derivative product thereof together with pharmaceutically acceptable diluents, preservatives, solubilizes, emulsifiers, adjuvants and/or carriers. Such compositions include diluents of various buffer content (e.g., Tris-HCl, acetate, phosphate), pH and ionic strength and additives such as detergents and solubilizing agents (e.g., Tween 80, Polysorbate 80), anti-oxidants (e.g., ascorbic acid, sodium metabisulfite), preservatives (e.g., Thimersol, benzyl alcohol) and bulking substances (e.g., lactose, mannitol). The material may be incorporated into particulate preparations of polymeric compounds such as polylactic acid, polyglycolic acid, etc. or into liposomes. Hylauronic acid may also be used. Such compositions may influence the physical state, stability, rate of in vivo release, and rate of in vivo clearance of the present proteins and derivatives. See, e.g., Martin, Remington's Pharmaceutical Sciences, 18th Ed. 1990, Mack Publishing Co., Easton, Pa., pp 1435-1712 that are herein incorporated by reference. The compositions may be prepared in liquid form, or may be in dried powder, such as lyophilised form.

[0335] The present invention also provides for the use of PMC virus amino acid sequences according to the invention, for manufacture of a medicament for modulation of a disease associated with PMC virus.

Antibody Based Therapeutics

[0336] The present invention also provides therapeutic compositions comprising antibodies prepared against the polypeptides of the invention.

[0337] The antibodies can be used directly as antiviral agents. To prepare antibodies, a host animal is immunized using one or more PMC virus proteins bound to a carrier as described above for vaccines. The host serum or plasma is collected following an appropriate time interval to provide a composition comprising antibodies reactive with the protein (s) of the virus particle. The gamma globulin fraction or the IgG antibodies can be obtained, for example, by use of saturated ammonium sulfate or DEAE Sephadex, or other techniques known to those skilled in the art. The antibodies are substantially free of many of the adverse side effects which may be associated with other anti-viral agents such as drugs.

[0338] Such therapeutic antibody compositions may additionally contain one or more of the additional agents described above in relation to polypeptide therapeutics.

[0339] The present invention provides for the use of antibodies against the PMC virus according to the invention, for manufacture of a medicament for modulation of a disease associated with PMC virus.

Polynucleotide Base Therapy

[0340] The present invention further provides therapeutic compositions comprising PMC virus nucleic acid sequences as well as antisense and ribozyme polynucleotide sequences hybridisable to a polynucleotide sequence encoding a PMC virus amino acid sequence according to the invention.

[0341] Polynucleotide sequences encoding antisense constructs or ribozymes for use in therapeutic methods are desirably administered directly as a naked nucleic acid construct. Uptake of naked nucleic acid constructs is enhanced by several known transfection techniques, for example those including the use of transfection agents. Example of these agents include cationic agents (for example calcium phosphate and DEAE-dextran) and lipofectants (for example Lipofectam™ and Transfectam™). Typically, nucleic acid constructs are mixed with the transfection agent to produce a composition.

[0342] Alternatively the antisense construct or ribozymes may be combined with a pharmaceutically acceptable carrier or diluent to produce a pharmaceutical composition. Suitable carriers and diluents include isotonic saline solutions, for example phosphate-buffered saline. The composition may be formulated for parenteral, intramuscular, intravenous, subcutaneous, intraocular, oral or transdermal administration.

[0343] Also addressed by the present invention is the use of polynucleotide sequences of the invention, as well as antisense and ribozyme polynucleotide sequences hybridisable to a polynucleotide sequence encoding a PMC virus amino acid sequence according to the invention, for manufacture of a medicament for modulation of a disease associated with PMC virus.

Administration of Therapeutic Compositions

[0344] It will be appreciated that therapeutic compositions provided accordingly to the invention may be administered by any means known in the art. Therapeutic compositions may be for administration by injection, or prepared for oral, pulmonary, nasal or other forms of administration. The mode of administration of the therapeutic compositions prepared in accordance with the invention will necessarily depend upon such factors as the stability of the complex under physiological conditions, the intensity of the immune response required etc.

[0345] Preferably, the pharmaceutical compositions for administration are administered by injection, orally, or by the pulmonary, or nasal route.

[0346] Preferably, the therapeutic compositions are administered using standard procedures, for example, intravenously, subcutaneously, intramuscularly, intraorbitally, ophthalmically, intraventricularly, intracranially, intracapsularly, intraspinally, intracisternally, intraperitoneally, buccal, rectally, vaginally, intranasally, orally or by aerosol administration.

[0347] The PMC virus amino acid sequence or antibodies derived there from, or polynucleotide sequences are more preferably delivered by intravenous, intra-arterial, intraperitoneal, intramuscular, or subcutaneous routes of administration. Alternatively, the PMC virus amino acid sequence or antibodies derived there from, properly formulated, can be administered by nasal or oral administration. The routes of administration described are intended only as a guide since a skilled practitioner will be able to determine readily the optimum route of administration and any dosage for any particular animal and condition.

[0348] The present invention further provides a method of inducing a protective immune response in an animal or human against a PMC virus comprising the steps of:

[0349] a) administering to said animal or human an effective amount of a composition of the invention.

[0350] The present invention also provides methods for enhancing an animal's immunocompetence and the activity of its immune effector cells against a PMC virus comprising the step of:

[0351] a) administering a composition comprising a therapeutically effective amount of a PMC virus peptide or polypeptide.

Live Vector Delivery Agent

[0352] In another aspect of the invention, the PMC virus may be used as a live vector for delivery of recombinant antigens.

[0353] Thus, the present invention provides a live vector comprising the PMC virus and a heterologous polynucleotide.

[0354] Preferably, the heterlolgous polynucleotide is operably linked to the polyneucletide sequence of the PMC virus, such that expression of the polynucleotide sequence of the PMC virus also leads to expression of the heterologous polynucleotide sequence.

[0355] Furthermore, the PMC virus may have one or more sections of autologous polynucleotide sequence removed. Removal of such sequence may preferably render the live virus attentauted in pathogenicity in a host subject.

[0356] For example, the PMC virus may be used as a delivery vector to deliver gene sequences that encode a protein from a second infective agent into a subject to be vaccinated against the second infective agent. The second infective agent may be a virus (such as classical swine fever virus), a bacteria, a parasite etc.

[0357] Alternatively, the PMC virus may be used as a delivery vector to deliver antigens from some other source. For example, a PMC virus vector may be used to deliver antigenic proteins to a subject to stimulate the subject to make antibodies against the antigenic proteins that may be collected for purposes such as use in diagnostic kits etc.

Drug Screening Assays

[0358] The present invention also provides assays that are suitable for identifying substances such as drugs, agents or ligands that bind to PMC virus amino acid sequences. In addition, assays are provided that are suitable for identifying substances that interfere with PMC virus amino acid sequences. Assays are also provided that test the effects of candidate substances identified in preliminary in vitro assays on intact cells in whole cell assays.

[0359] Thus, the present invention provides a method of screening for drugs comprising the steps of:

[0360] a) contacting an agent with a PMC virus amino acid sequence or fragment thereof and

[0361] b) assaying for the presence of a complex between the agent and the PMC virus amino acid sequence or fragment.

[0362] The present invention also provides a method of screening for ligands of the proteins of the PMC virus comprising the steps of:

[0363] a) contacting a ligand with a PMC virus amino acid sequence or fragment thereof and

[0364] b) assaying for the presence of a complex between the PMC virus amino acid sequence or fragment and a ligand.

[0365] One type of assay for identifying substances such as drugs, agents or ligands that bind to PMC virus amino acid sequences involves contacting a PMC virus amino acid sequence, which is immobilised on a solid support, with a non-immobilised candidate substance and determining whether and/or to what extent the PMC virus amino acid sequences and candidate substance bind to each other. Alternatively, the candidate substance may be immobilised and the PMC virus amino acid sequence non-immobilised.

[0366] In a preferred assay method, the PMC virus amino acid sequence is immobilised on beads such as agarose beads. Typically this is achieved by expressing the component as a GST-fusion protein in bacteria, yeast or higher eukaryotic cell lines and purifying the GST-fusion protein from crude cell extracts using glutathione-agarose beads. The binding of the candidate substance to the immobilised PMC virus amino acid sequence is then determined. This type of assay is known in the art as a GST pulldown assay. Again, the candidate substance may be immobilised and the PMC virus amino acid sequence non-immobilised.

[0367] It is also possible to perform this type of assay using different affinity purification systems for immobilising one of the components, for example Ni-NTA agarose and hexahistidine-tagged components.

[0368] Binding of the PMC virus amino acid sequence to the candidate substance may be determined by a variety of methods well known in the art. For example, the non-immobilised component may be labelled (with for example, a radioactive label, an epitope tag or an enzyme-antibody conjugate). Alternatively, binding may be determined by immunological detection techniques. For example, the reaction mixture can be Western blotted and the blot probed with an antibody that detects the non-immobilised component. ELISA techniques may also be used.

[0369] Candidate substances are typically added to a final concentration of from 1 to 1000 nmol/ml, more preferably from 1 to 100 nmol/ml. In the case of antibodies, the final concentration used is typically from 100 to 500 μg/ml, more preferably from 200 to 300 μg/ml.

[0370] In a competitive binding assay the PMC virus amino acid sequence or fragment is typically labelled. Free PMC virus amino acid sequence or fragment is separated from that present in a protein:protein complex, and the amount of free (i.e., uncomplexed) label is a measure of the binding of the agent being tested to the PMC virus amino acid sequence or its interference with PMC virus amino acid sequence:ligand binding, respectively.

[0371] Another technique for drug screening provides high throughput screening for compounds having suitable binding affinity to the PMC virus amino acid sequence and is described in detail in PCT Application WO 84/03564, published on Sep. 13, 1984. Briefly stated, large numbers of different small peptide test compounds are synthesised on a solid substrate, such as plastic pins or some other surface. The peptide test compounds are reacted with PMC virus amino acid sequence and washed. Bound PMC virus amino acid sequence is then detected by methods well known in the art.

[0372] This invention also contemplates the use of competitive drug screening assays in which antibodies capable of specifically binding the PMC virus amino acid sequence compete with a test compound for binding to the PMC virus amino acid sequence or fragments thereof. In this manner, the antibodies can be used to detect the presence of any peptide that shares one or more antigenic determinants of the PMC virus amino acid sequence.

Kits

[0373] In a further embodiment of this invention, kits may be prepared to determine the presence or absence of PMC virus in suspected infected animals and/or to quantitatively

measure PMC infection. In accordance with the testing techniques discussed above, one class of such kits will contain at least the labelled PMC virus amino acid sequence or its binding partner, for instance an antibody specific thereto, and directions depending upon the method selected, e.g., "competitive," "sandwich," "DASP" and the like. The kits may also contain peripheral reagents such as buffers, stabilizers, etc.

[0374] Thus, kits for PMC virus serum immunoassay may be either (a) a sandwich type immunoassay, employing a first anti-PMC virus antibody as capture or detector antibody and a second anti-PMC virus antibody as a detector or capture antibody to complement the first anti-PMC virus antibody, or (b) a competitive type immunoassay, employing a anti-PMC virus antibody with a labelled PMC virus antigen or a PMC virus antigen attached to a solid phase.

[0375] Accordingly, a test kit may be prepared for the demonstration of the presence of PMC virus comprising:

[0376] (a) a predetermined amount of at least one labelled immunochemically reactive component obtained by the direct or indirect attachment of the present PMC virus amino acid sequence or a specific binding partner thereto, to a detectable label;

[0377] (b) other reagents; and

[0378] (c) directions for use of said kit.

[0379] More specifically, the diagnostic test kit may comprise:

[0380] (a) a known amount of the PMC virus amino acid sequence as described above (or a binding partner) generally bound to a solid phase to form an immunosorbent, or in the alternative, bound to a suitable tag, or there are a plural of such end products, etc;

[0381] (b) if necessary, other reagents; and

[0382] (c) directions for use of said test kit.

[0383] In a further variation, the test kit may be prepared and used for the purposes stated above, which operates according to a predetermined protocol (e.g. "competitive," "sandwich," "double antibody," etc.), and comprises:

[0384] (a) a labelled component which has been obtained by coupling the PMC virus amino acid sequence to a detectable label;

[0385] (b) one or more additional immunochemical reagents of which at least one reagent is a ligand or an immobilized ligand, which ligand is selected from the group consisting of:

[0386] (i) a ligand capable of binding with the labelled component (a);

[0387] (ii) a ligand capable of binding with a binding partner of the labelled component (a);

[0388] (iii) a ligand capable of binding with at least one of the component(s) to be determined; or

[0389] (iv) a ligand capable of binding with at least one of the binding partners of at least one of the component(s) to be determined; and

[0390] (c) directions for the performance of a protocol for the detection and/or determination of one or more components of an immunochemical reaction between the PMC virus amino acid sequence and a specific binding partner thereto.

Kits to Detect Antibodies

[0391] The invention also provides diagnostic kits for the in vitro detection of antibodies against the PMC virus, which kits comprise any of the polypeptides identified herein and all the biological and chemical reagents, as well as equipment, necessary for performing diagnostic assays.

[0392] Accordingly, the invention provides a kit for demonstrating the presence of PMC virus comprising:

[0393] (a) a predetermined amount of at least one labelled antibody to the PMC virus;

[0394] (b) other reagents; and

[0395] (c) directions for use of said kit.

[0396] Preferably, the polypeptide used in the kit is an antigenic or epitope bearing polypeptide. Most preferably, the polypeptide is a polypeptide encoding, but not exclusively limited to, the E0, E2, NS2 or NS3 protein.

[0397] Preferred kits comprise all reagents required for carrying out ELISA assays. Thus preferred kits will include, in addition to any of said polypeptides, suitable buffers and anti-species immunoglobulins, which anti-species immunoglobulins are labelled either by an immunofluorescent molecule or by an enzyme. In the last instance, preferred kits also comprise a substrate hydrolysable by the enzyme and providing a signal, particularly modified absorption of a radiation, at least in a determined wavelength, which signal is then indicative of the presence of antibody in the biological fluid to be assayed with said kit. Kits may also include labelled monoclonal or polyclonal antibodies that are directed against PMC virus epitopes and these labelled antibodies may be used to block or compete with antibodies from the test specimen. If the activity of the labelled antibody is blocked, no or a reduced reaction will occur and it can be deduced that the test specimen contains antibodies to PMC virus.

[0398] The present invention also relates to a diagnostic kit for use in detecting the presence of PMC virus antibodies, said kit comprising at least one peptide as defined above, with said peptide being preferably bound to a solid support.

[0399] The peptide, for example, can be attached to a variety of different solid supports to enable the washing away of unreacted reagents during the course of using the kit. These include: microwells, coated test tubes, coated magnetic particles, wands or sticks, and membranes (nitrocellulose and others).

[0400] Preferably, the peptides are attached to specific locations on the solid support. More preferably, the solid support is a membrane strip and said peptides are coupled to the membrane in the form of parallel lines. Preferably, the peptide used in the kit is an antigenic or epitope bearing peptide.

[0401] The PMC virus antigens of the present invention will typically be packaged in the form of a kit for use in these immunoassays. The kit will normally contain, in separate containers, the PMC virus antigen, control antibody formulations (positive and/or negative), labelled antibody when the assay format requires the same and signal generating reagents (e.g. enzyme substrate) if the label does not generate a signal directly. The PMC virus antigen may be already bound to a solid support or may be provided separately, with reagents for binding it to the solid support. Instructions (e.g. written, tape, CD-ROM, etc.) for carrying out the assay usually will be included in the kit.

[0402] Immunoassays that utilize PMC virus antigens are useful in screening samples (such as blood, serum, plasma, milk, body fluids) to detect if the subject from which the tissue was derived has been exposed to or infected with PMC virus.

[0403] The solid support used in the kits of the present invention can include polymeric or glass beads, nitrocellulose, microparticles, microwells of a reaction tray, test tubes and magnetic beads.

[0404] The signal generating compound can include an enzyme, a luminescent compound, a fluorophore such as fluorescein, a time-resolved fluorescent probe such as a europium chelate, a chromogen, a radioactive element, a chemiluminescent compound such as an acridinium ester or particles such as colloidal gold, plain latex, or dyed latex. Examples of enzymes include alkaline phosphatase, horseradish peroxidase and beta-galactosidase.

Kits to Detect Polypeptides and Antigens

[0405] The present invention further provides a diagnostic kit for use in detecting the presence of PMC virus proteins.

[0406] Accordingly, the invention provides a kit for demonstrating the presence of PMC virus comprising:

[0407] (a) a predetermined amount of at least one labelled polypeptide derived from the PMC virus;

[0408] (b) other reagents; and

[0409] (c) directions for use of said kit.

[0410] Preferably, said antibody is bound to a solid support. The antibody can be attached to a variety of different solid supports to enable the washing away of unreacted reagents during the course of using the kit. These include: microwells, coated test tubes, coated magnetic particles, wands or sticks, and membranes (nitrocellulose and others). Preferably, the antibodies are attached to specific locations on a solid substrate.

[0411] The anti-PMC virus antibody can be attached to the solid support by a variety of means such as passive adsorption, covalent coupling, or by using a solid phase pre-coated with a secondary binder such as protein A, protein G, a secondary antibody specific for the primary antibody, avidin, or an antibody specific for a particular ligand (i.e.: biotin, dinitrophenol, fluorescein, and others). In the case of avidin or any of the ligand specific antibodies, it is necessary to covalently attach the ligand to the anti-PMC virus antibody.

[0412] For example, ELISA kits may be used to detect the presence of antigens to PMC virus in a sample to demonstrate that an animal is suffering from PMC or is, for example, a non-symptomatic carrier of the virus.

[0413] Preferably, the protein to be detected using the present kit is an antigen or an epitope bearing region of a PMC virus protein. Most preferably, the antibody binds to the E0, E2, NS2 or NS3 protein of PMC.

Kits to Detect Nucleic Acid Sequences

[0414] The invention also provides kits for screening animals suspected of being infected with PMC virus, or to confirm that an animal is infected with PMC virus, by detecting PMC virus nucleic acid sequences.

[0415] Accordingly, the invention provides a kit for demonstrating the presence of PMC virus comprising:

[0416] (a) a predetermined amount of at least one labelled nucleic acid sequence derived from the PMC virus;

[0417] (b) other reagents; and

[0418] (c) directions for use of said kit.

[0419] For example, the polynucleotide sequence may be one or more primers, such as those exemplified above, and the instructions for use may be instructions to perform PCR on RNA or DNA extracted from a tissue sample from a subject.

Vectors, Host Cells Etc

Vectors

[0420] The present invention also provides a recombinant expression vector comprising a PMC virus nucleic acid sequence or a part thereof as defined above, operably linked to prokaryotic, eukaryotic or viral transcription and translation control elements.

[0421] The invention further relates to the hosts (prokaryotic or eukaryotic cells) which are transformed by the above mentioned vectors and recombinants and which are capable of expressing said RNA and/or DNA fragments.

[0422] According to another embodiment the present invention provides methods for preparing a PMC virus amino acid sequence, comprising the steps of:

[0423] (a) culturing a host cell containing a vector as described above under conditions that provide for expression of the PMC virus amino acid sequence; and

[0424] (b) recovering the expressed PMC virus sequence.

[0425] This procedure can also be accompanied by the step of:

[0426] (c) subjecting the amino acid sequence to protein purification.

[0427] The present invention also relates to a method for the production of a recombinant PMC virus polypeptide, comprising the steps of:

[0428] a) transforming an appropriate cellular host with a recombinant vector, in which a PMC virus polynucleotide sequence or a part thereof has been inserted under the control of appropriate regulatory elements,

[0429] b) culturing said transformed cellular host under conditions enabling the expression of said insert, and,

[0430] c) harvesting said polypeptide.

[0431] Vectors provided by the present invention will typically comprise a PMC virus polynucleotide sequence encoding the desired amino acid sequence and preferably transcription and translational regulatory sequences operably linked to the amino acid encoding sequence so as to allow for the expression of the antigenic polypeptide in the cell. Preferably, the vector will include appropriate prokaryotic, eukaryotic or viral promoter sequence followed by the PMC virus nucleotide sequences as defined above. The recombinant vector of the present invention may preferably allow the expression of any one of the PMC virus polypeptides as defined above in a prokaryotic, or eukaryotic host or in living mammals when injected as naked RNA or DNA.

[0432] The vector may comprise a plasmid, a cosmid, a phage, or a virus or a transgenic animal. Particularly useful for vaccine development may be BCG or adenoviral vectors, as well as avipox recombinant viruses. Examples of such expression vectors are described in Sambrook et al., (1989) supra or Ausubel et al., (2001) supra. Many useful vectors are known in the art and may be obtained from such vendors as Stratagene, New England Biolabs, Promega Biotech, and others.

[0433] It may be desirable to use regulatory control sequences that allow for inducible expression of the antigenic polypeptide, for example in response to the administration of an exogenous molecule. Alternatively, temporal control of

expression of the antigenic polypeptide may occur by only introducing the polynucleotide into the cell when it is desired to express the polypeptide.

[0434] It may also be convenient to include an N-terminal secretion signal so that the antigenic polypeptide is secreted into the cell medium.

[0435] Expression vectors may also include, for example, an origin of replication or autonomously replicating sequence and expression control sequences, a promoter, an enhancer and necessary processing information sites, such as ribosome-binding sites, RNA splice sites, polyadenylation sites, transcriptional terminator sequences, and mRNA stabilising sequences. Secretion signals may also be included where appropriate, from secreted polypeptides of the same or related species, which allow the protein to cross and/or lodge in cell membranes, and thus attain its functional topology, or to be secreted from the cell. Such vectors may be prepared by means of standard recombinant techniques well known in the art and discussed, for example, in Sambrook et al., (1989) or Ausubel et al., (2001).

[0436] An appropriate promoter and other necessary vector sequences will be selected so as to be functional in the host, and may include, when appropriate, those naturally associated with outer membrane lipoprotein genes.

[0437] Promoters such as the trp, lac and phage promoters, tRNA promoters and glycolytic enzyme promoters may be used in prokaryotic hosts. Useful yeast promoters include promoter regions for metallothionein, 3-phosphoglycerate kinase or other glycolytic enzymes such as enolase or glyceraldehyde-3-phosphate dehydrogenase, enzymes responsible for maltose and galactose utilization, and others. Vectors and promoters suitable for use in yeast expression are further described in Hitzeman et al., EP 73,675A. Appropriate non-native mammalian promoters might include the early and late promoters from SV40 or promoters derived from murine Moloney leukaemia virus, avian sarcoma viruses, adenovirus II, bovine papilloma virus or polyoma. In addition, the construct may be joined to an amplifiable gene (e.g., DHFR) so that multiple copies of the gene may be made.

[0438] While such expression vectors may replicate autonomously, they may also replicate by being inserted into the genome of the host cell, by methods well known in the art.

[0439] Expression and cloning vectors will likely contain a selectable marker, a gene encoding a protein necessary for survival or growth of a host cell transformed with the vector. The presence of this gene ensures growth of only those host cells that express the inserts. Typical selection genes encode proteins that a) confer resistance to antibiotics or other toxic substances, e.g. ampicillin, neomycin, methotrexate, etc.; b) complement auxotrophic deficiencies, or c) supply critical nutrients not available from complex media, e.g., the gene encoding D-alanine racemase for *Bacilli*. The choice of the proper selectable marker will depend on the host cell, and appropriate markers for different hosts are well known in the art.

[0440] Vectors containing PMC virus polynucleotide sequences can be transcribed in vitro and the resulting RNA introduced into the host cell by well-known methods, e.g., by injection, or the vectors can be introduced directly into host cells by methods well known in the art, which vary depending on the type of cellular host, including electroporation; transfection employing calcium chloride, rubidium chloride, calcium phosphate, DEAE-dextran, or other substances; microprojectile bombardment; lipofection; infection (where the vector is an infectious agent, such as a retroviral genome); and other methods. The introduction of PMC virus polynucleotide sequences into the host cell may be achieved by any method known in the art, including, inter alia, those described above.

[0441] In a preferred embodiment, the PMC virus polynucleotide is part of a viral vector, such as a baculovirus vector, or infectious virus, such as a baculovirus. This provides a convenient system since not only can recombinant viral stocks can be maintained and stored until ready for use. Desirably, the nucleotide sequence encoding the antigenic peptide or polypeptides is inserted into a recombinant baculovirus that has been genetically engineered to produce antigenic peptide or polypeptides, for instance, by following the methods of Smith et al (1983) *Mol Cell Biol* 12: 2156-2165. A number of viral transfer vectors allow more than one polynucleotide sequence encoding a polypeptide to be inserted into the same vector so that they can be co-expressed by the same recombinant virus.

Host Cells

[0442] To produce a cell capable of expressing PMC virus amino acid sequences, preferably polynucleotide sequences of the invention are incorporated into a recombinant vector, which is then introduced into a host prokaryotic or eukaryotic cell.

[0443] The invention also provides host cells transformed or transfected with a PMC virus polynucleotide sequence. Preferred host cells include yeast, filamentous fungi, plant cells, insect, amphibian, avian species, bacteria, mammalian cells, and human cells in tissue culture. Illustratively, such host cells are selected from the group consisting of *E. coli, Pseudomonas, Bacillus, Streptomyces*, yeast, CHO, R1.1, B-W, L-M, COS1. COS 7, BSC1, BSC40, BMT10, and Sf9 cells.

[0444] Large quantities of PMC virus polynucleotide sequence of the invention may be prepared by expressing PMC virus polynucleotide sequences or portions thereof in vectors or other expression vehicles in compatible prokaryotic or eukaryotic host cells. The most commonly used prokaryotic hosts are strains of *Escherichia coli*, although other prokaryotes, such as *Bacillus subtilis* or *Pseudomonas* may also be used. Examples of commonly used mammalian host cell lines are VERO and HeLa cells, Chinese hamster ovary (CHO) cells, and WI38, BHK, and COS cell lines, although it will be appreciated by the skilled practitioner that other cell lines may be appropriate.

[0445] Also provided are mammalian cells containing a PMC virus polynucleotide sequences modified in vitro to permit higher expression of PMC virus amino acid sequence by means of a homologous recombinational event consisting of inserting an expression regulatory sequence in functional proximity to the PMC virus amino acid sequence encoding sequence.

[0446] The invention is not limited to the production of one antigenic polypeptide at a time in the host cell. Multiple polynucleotides encoding different antigenic polypeptides of interest may be introduced into the same host cell. The polynucleotides may be part of the same nucleic acid molecule or separate nucleic acid molecules.

General

[0447] Those skilled in the art will appreciate that the invention described herein is susceptible to variations and

modifications other than those specifically described. It is to be understood that the invention includes all such variations and modifications. The invention also includes all of the steps, features, compositions and compounds referred to or indicated in the specification, individually or collectively and any and all combinations or any two or more of the steps or features.

[0448] The present invention is not to be limited in scope by the specific embodiments described herein, which are intended for the purpose of exemplification only. Functionally equivalent products, compositions and methods are clearly within the scope of the invention as described herein.

[0449] The entire disclosures of all publications (including patents, patent applications, journal articles, laboratory manuals, books, or other documents) cited herein are hereby incorporated by reference. No admission is made that any of the references constitute prior art or are part of the common general knowledge of those working in the field to which this invention relates.

[0450] As used herein the term "derived" and "derived from" shall be taken to indicate that a specific integer may be obtained from a particular source albeit not necessarily directly from that source.

[0451] Throughout this specification, unless the context requires otherwise, the word "comprise", or variations such as "comprises" or "comprising", will be understood to imply the inclusion of a stated integer or group of integers but not the exclusion of any other integer or group of integers.

[0452] Other definitions for selected terms used herein may be found within the detailed description of the invention and apply throughout. Unless otherwise defined, all other scientific and technical terms used herein have the same meaning as commonly understood to one of ordinary skill in the art to which the invention belongs.

EXAMPLES

[0453] The following examples serve to more fully describe the manner of using the above-described invention, as well as to set forth the best modes contemplated for carrying out various aspects of the invention. It is understood that these methods in no way serve to limit the true scope of this invention, but rather are presented for illustrative purposes.

Example 1

Sample Preparation

[0454] Tissue samples were extracted and prepared using a method whose main basis was derived from Allander et al (2001) "A virus discovery method incorporating DNase treatment and its application to the identification of two bovine parvovirus species." Proc Natl Acad Sci USA. 98(20): 11609-14, with some modifications to improve the efficiency from Baugh et al (2001) "Quantitative analysis of mRNA amplification by in vitro transcription." Nucleic Acids Res. 29(5): E29. However, the methods were modified to improve efficiency.

1. Preparation of Serum Samples:

[0455] a) Obtain at least 240 μL of supernatant from a tissue homogenate or serum and divide into 2×120 ul lots

[0456] b) To each 120 ul of sample add 240 ul of PBS or H_2O (or take 50 ul sera+100 ul PBS)

[0457] c) Filter diluted sample through two separate 0.2 um filters by centrifuging at 2000×g (wash top of filter and keep at −20° C.)

[0458] d) Add 25 ul DNASE I (250 U) to each tube of filtered sample and incubate at 37° C. for 2 hr

[0459] e) Add 1 ul of RNase Cocktail (500 U Rnase A, 20000 U Rnase T1) to each tube and incubate at RT for 1 hr.

[0460] f) Take 1 tube of treated sample (360 ul) for RNA extraction and one tube for DNA extraction (add 500 ul DNAeasy AL+50 ul proteinase K etc and elute in 50 ul water).

2. RNA Extraction:

[0461] a) Divide sample into 90 ul lots and add 600 ul RLT, ie 4×690 ul

[0462] b) Homogenize by passing through 21 G syringe at least 5×

[0463] c) Add 690 ul of 70% ethanol to each tube of sample and mix by pipetting

[0464] d) Apply 700 ul of sample to column at a time and centrifuge for 15 sec at 10,000 rpm. Place flow through waste in a 5 ml container and keep at −80° C.

[0465] e) Add 700 ul of buffer RW1 to the column and centrifuge for 15 sec at 10,000 rpm. Discard flow through material and collection tube.

[0466] f) Transfer column to a new tube and add 500 ul of RPE centrifuge for 15 sec at 10,000 rpm, discard flow through material

[0467] g) Repeat step (f) using same tube but centrifuge for 2 min at 10,000 rpm.

[0468] h) Transfer column to a new tube and centrifuge for 1 min at 10,000 rpm.

[0469] i) Elute the RNA in 20 ul of RNAse free water, let the water sit on the column for 1 minute before centrifuging. Reuse the eluate and centrifuge for 1 min at 10,000 rpm to collect any left over RNA on column.

[0470] j) Store RNA at −80° C. until needed.

3. DNA Extraction:

[0471] a) To 360 ul of sample add 36 ul of proteinase K and 360 ul of buffer AL, mix by vortex, incubate at 70° C. for 10 minutes.

[0472] b) Add 360 ul of 100% ethanol, mix by vortexing

[0473] c) Pipette mixture from step (b) into DNAeasy column and centrifuge at 8,000 rpm for 1 minute. Place flow-through into a tube and store at −80° C.

[0474] d) Place column in a new tube and add 500 ul of AW1 spin at 8,000 rpm for 1 minute. Discard flow through and tube.

[0475] e) Place column in a new tube and add 500 ul of AW2 and spin at 13,000 rpm for 3 minutes. Discard flow through and spin for another 1 minute and discard flow through and tube.

[0476] f) Place column in a new tube, add 50 ul of water and let sit for 1 minute. Spin at 8,000 rpm for 1 min and collect eluate. Reapply the 50 ul eluate and spin again.

[0477] g) Store DNA at −80° C. until needed.

RNA Sequence-independent Single Primer Amplification (SISPA) for Double Stranded RNA Viruses

[0478] The SISPA method employed was developed from that of Baugh et al and Allander et al, to maximise yield and product length while minimising template-independent side

reactions. However, the present method is applied to low yield viral RNA, not total mRNA and a melting step has been added.

4. First Strand cDNA Synthesis

[0479] a) Mix Together the Following:

[0480] 1 ul random hexamers (10 μmol)

[0481] 8 ul-9 ul RNA (in H_2O)

[0482] b) Mix, heat 90° C. 3 minutes, spin and put on ice

[0483] c) On ice add:

1st strand buffer	4 ul
0.1M dTT	2 ul
5 mM dNTP	2 ul
SSIII (400 U)	1 ul
T4gene32	1 ul

1st strand buffer: 50 mM Tris-HCl (pH 8.3), 75 mM KCl, 3 mM $MgCl_2$

[0484] d) Mix, spin and heat at 50° C. for 30 minutes

[0485] e) Add another 1 ul of SSIII and leave for another 30 min at 50° C.

[0486] f) Heat inactivate at 70° C. for 10 minutes and then place on ice

5. Second Strand cDNA Synthesis

[0487] a) On ice mix:

H2O	87 ul
5X 2nd strand buffer	30 ul
5 mM dNTPs	6 ul
DNA polymerase (40 U)	4 ul
E. coli DNA ligase (10 U)	1 ul
RNase H (2 U)	2 ul
1st strand DNA mix (step 1)	20 ul

2nd Strand Buffer: 20 mM Tris-HCl (pH 6.9), 4.6 mM $MgCl_2$, 90 mM KCl, 0.15 mM b-NAD+, 10 mM $(NH_4)_2SO_4$

[0488] b) Mix, spin and incubate at 16° C. for 2 hrs. *NOTE: can start DNA SISPA whilst this incubation is underway.*

[0489] c) Add 10 ul (10 U) T4 DNA polymerase (1 u/ul) and incubate at 16° C. for 15 min.

[0490] d) Heat 2nd strand synthesis at 72° C. 10 minutes, let cool to 37° C.

6. Clean up DNA

[0491] a) Spin phase lock at 13,000 rpm for 30 sec at 4° C.

[0492] b) Add 150 ul of step 2 reaction

[0493] c) Add equal volume phenol/chloroform 160 ul

[0494] d) Shake lightly

[0495] e) Spin at 13000 rpm 5 minutes, 4° C.

[0496] f) Transfer upper phase to new tube ~160 ul

[0497] g) Precipitate DNA add 100% ethanol 2.5V i.e 375 ul and 1 ul glycogen (20 mg/ml) Leave at −20° C. for 2 hrs or O/N

[0498] h) Spin at 13000 rpm 20 minutes, remove S/N off pellet

[0499] i) Wash pellet 1×70% ethanol 13000 rpm 5 min at 4° C.

[0500] j) Take pellet up in 35 ul of water *NOTE: can stop here and freeze at −80° C. until the DNA SISPA sample is also ready.*

DNA SISPA

7. Second DNA Strand Synthesis

[0501] a) Mix together the following:

DNA	50 ul
10 pmol random hexamers (10 pmol/ul)	1 ul
5 U 3'-5' exo Klenow fragment DNA polymerase	1 ul
Buffer (supplied with Klenow fragment DNA polymerase)	1 ul
5 mM dNTP	1 ul
T4gene32	1 ul

[0502] b) Leave at 37° C. for 1 hr

8. Clean up DNA

[0503] a) Spin phase lock at 13,000 rpm for 30 sec at 4° C.

[0504] b) Add 60 ul of step 1 reaction

[0505] c) Add equal volume phenol/chloroform 60 ul

[0506] d) Shake lightly

[0507] e) Spin at 13,000 rpm 5 minutes, 4° C.

[0508] f) Transfer upper phase to new tube ~60 ul

[0509] g) Precipitate DNA add 100% ethanol 2.5V i.e 150 ul and 1 ul glycogen (20 mg/ml) Leave at −20° C. for 2 hrs or overnight

[0510] h) Spin at 13,000 rpm for 20 minutes, remove supernatant off pellet

[0511] i) Wash pellet 1×70% ethanol 13,000 rpm 5 min at 4° C.

[0512] j) Take pellet up in 44 ul of water *NOTE: can stop here and freeze at −80° C. until the RNA SISPA sample is also ready.*

Generation of Recombinant Nucleic Acid Sequences

9. Restriction Digest

[0513] a) Add 10 U Csp 6.1 (i.e 1 ul of 10 U/ul stock) to 35 ul of sample, add 4 ul of Buffer B and 5 ul of Csp6I

[0514] b) Incubate at 37° C. for 2 hr

[0515] c) Inactivate at 65° C. for 20 minutes

10. Dephosphorylate digested DNA

[0516] a) To inactivated restriction digest (50 ul) add:

[0517] 6 ul of 10×CIP dephosphorylation buffer

[0518] 0.3 ul of CIP 18 U/ul

[0519] 3.7 ul water

CIP Dephosphorylase buffer 1×: 0.05M Tris-HCl, 0.1 mM EDTA, pH8.5

[0520] b) Incubate at 37° C. for 30 minutes

[0521] c) Add another 0.3 ul of CIP 18 U/ul and incubate at 37° C. for 30 minutes

11. Clean Up DNA

[0522] a) Spin phase lock at 13,000 rpm for 30 sec at 4° C.

[0523] b) Add 60 ul dephosphorylated DNA

[0524] c) Add equal volume (60 ul) phenol/chloroform

[0525] d) Shake lightly

[0526] e) Spin at 13,000 rpm 5 minutes, 4° C.

[0527] f) Transfer upper phase to new tube ~50 ul

[0528] g) Precipitate DNA add 2.5 volumes 100% ethanol (150 ul) and 1 ul glycogen (20 mg/ml) Leave at −20° C. for 2 hrs or overnight

[0529] h) Spin at 13,000 rpm 20 minutes, remove supernatant off pellet

[0530] i) Wash pellet 1×70% ethanol, spin 13,000 rpm 5 min at 4° C.

[0531] j) Dessicate for 2-3 minutes or air dry for 15 minutes

[0532] k) Reconstitute in 5.8 ul H_2O.

12. Adaptor Ligation

[0533] a) Mix together:

T4 DNA ligase (5 U/ul)	1.2 ul
5x Ligase Buffer	2 ul
50 pmol adaptor (phosphorylated ends)	1 ul
DNA from Step 3.	5.8 ul

Ligase buffer 5X: 330 mM Tris-HCl, 25 mM $MgCl_2$, 25 mM DTT, 5 mM ATP, pH 7.5

[0534] b) Incubate 4° C. for 1 hr and 16° C. overnight

13. PCR Reaction (Results FIG. 2)

[0535] a) Set up the following mix:

Ligated DNA (step 4)	2 ul
50 pmol NBam24	1 ul
5 mM dNTP	2 ul
2 mM MgCl2	2 ul
10X PCR Buffer	5 ul
H_2O	38 ul

10X PCR buffer: 100 mM Tris-HCl, 500 mM KCl (pH 8.3)

[0536] b) Heat at 72° C. for 3 minutes

[0537] c) Add 0.5 ul Taq DNA polymerase (5 U/ul)

[0538] d) Run cycle:

[0539] 72° C. for 5 minutes

[0540] (94° C. for 1 minute, 72° C. for 3 minutes)×40 hold at 4° C.

[0541] e) Run 10 ul and 40 ul of product on 1.0% EtBr gel (leave a well between them to make purification easier)

14. Cloning PCR Product

[0542] a) Cut out sections of smeared region from gel as a lot of the dominant bands can be contaminating sequence from the products used in the methods, rather than the actual sample. Bands can also be hard to see if they are in the smeared regions.

[0543] b) Clean up DNA from agarose using the Minielute Gel Extraction Kit (Qiagen)

[0544] 1. Excise the DNA fragment from the agarose gel with a clean, sharp scalpel.

[0545] 2. Weigh the gel slice in a colourless tube. Add 3 volumes of Buffer QG to 1 volume of gel (100 mg~100 μl).

[0546] 3. Incubate at 50° C. for 10 min (or until the gel slice has completely dissolved). To help dissolve gel, mix by vortexing the tube every 2-3 min during the incubation.

[0547] 4. After the gel slice has dissolved completely, check that the colour of the mixture is yellow (similar to Buffer QG without dissolved agarose). Note: If the colour of the mixture is orange or violet, add 10 μl of 3 M sodium acetate, pH 5.0, and mix. The colour of the mixture will turn to yellow.

[0548] 5. Add 1 gel volume of isopropanol to the sample and mix by inverting the tube several times.

[0549] 6. Place a MinElute column in a provided 2 ml collection tube in a suitable rack.

[0550] 7. To bind DNA, apply the sample to the MinElute column, and centrifuge for 1 min.

[0551] 8. Discard the flow-through and place the MinElute column back in the same collection tube.

[0552] 9. Add 500 μl of Buffer QG to the spin column and centrifuge for 1 min.

[0553] 10. Discard the flow-through and place the MinElute column back in the same collection tube.

[0554] 11. To wash, add 750 μl of Buffer PE to the MinElute column and centrifuge for 1 min.

[0555] 12. Discard the flow-through and centrifuge the MinElute column for an additional 1 min at ≧10,000×g (~13,000 rpm).

[0556] 13. Place the MinElute column into a clean 1.5 ml microcentrifuge tube.

[0557] 14. To elute DNA, add 10 μl of Buffer EB (10 mM Tris.Cl, pH 8.5) or H_2O to the centre of the membrane, let the column stand for 1 min, and then centrifuge for 1 min.

[0558] c) For ligations and cloning use Invitrogen TA Cloning® Kit Version V 7. Set up the 10 μl ligation reaction as follows:

Fresh PCR product	6 μl
10X Ligation Buffer	1 μl
pCR ®2.1 vector (25 ng/μl)	2 μl
T4 DNA Ligase (4.0 Weiss units)	1 μl

Incubate the ligation reaction at 14° C. overnight, or at −20° C. until you are ready for transformation.

[0559] d) Transform One Shot® Competent Cells.

[0560] 1. Centrifuge vials containing the ligation reactions briefly and place them on ice.

[0561] 2. Thaw on ice one 50 μl vial of frozen One Shot® Competent Cells (enough for 2 ligations).

[0562] 3. Pipette 2 μl of each ligation reaction into 25 ul of competent cells and mix by stirring gently with the pipette tip.

[0563] 4. Incubate the vials on ice for 30 minutes. Store the remaining ligation mixtures at −20° C.

[0564] 5. Heat shock the cells for 30 seconds at 42° C. without shaking. Immediately transfer the vials to ice.

[0565] 6. Add 125 μl of room temperature SOC medium to each vial.

[0566] 7. Shake the vials horizontally at 37° C. for 1 hour at 225 rpm in a shaking incubator.

[0567] 8. Spread 50 μl to 100 μl from each transformation vial on LB agar plates containing ~80 mg/ml X-Gal and 100 μg/ml ampicillin.

[0568] 9. Incubate plates overnight at 37° C. Place plates at 4° C. for 2-3 hours to allow for proper colour development.

15. Screening Colonies for Inserts and Sequencing (Results FIG. 3)

[0569] a) Use HotStarTaqMaster Mix (50 ul/well of plate):

1X	110X (sufficient for one plate)
25 ul HotStarTaqMaster Mix (vortex)	2750 ul
12.5 ul M13-20f (50 pmol)	1375 ul
12.5 ul M13-20f (50 pmol)	1375 ul
add 50 ul per well of the plate	

To make the M13-20f (50 pmol) and M13r (50 pmol) stocks: mix 0.5 ul of 100 uM primer with 12 ul of water i.e 500 ul of 100 uM stock primer + 1200 ul water (from HotStarTaq Kit).

[0570] b) Place sterile aluminium foil over the plate containing the HotStar TaqMaster Mix. Stab through the foil to make a hole, and then stab a bacterial colony into each well of the plate.

[0571] c) Take off aluminium foil and add strip caps to seal plate.

[0572] d) Run PCR protocol:

[0573] 95° C. for 15 min

[0574] (94° C. for 30 s, 50° C. for 30 s, 72° C. for 1 min)×30

[0575] 72° C. for 1 min

[0576] 4° C. hold.

[0577] e) Run 5-10 ul of PCR on gel

[0578] f) Use Qiagen Mini elute to clean up the remaining PCR product to sequence.

Example 2

Enzyme Linked Immunosorbent Assay to Detect Antibodies to PMC Virus

[0579] 1. Clone and express the PMC virus protein of interest (eg E2, NS3) in baculovirus and purify the expressed protein. This purified protein can be used as an antigen to detect specific antibodies to the PMC virus proteins of interest.

2. Coat 'medium binding' 96 well microplates (50 uL per well) with antigen diluted in carbonate buffer (0.05M Carbonate buffer 1× (pH 9.6): Na_2CO_3 (1.59 gm); $NaHCO_3$ (2.93 gm) water to 1 L). Hold overnight at room temperature (18-25° C.).

3. Dilute samples and controls (Negative, High and Low Positive) 1/100 in sample diluent (phosphate buffered saline (pH 7.3) solution containing 1% skim milk powder and 0.05% Tween 20).

4. Wash plates 5 times with PBS-Tween and tap to dry.

5. Transfer diluted samples and controls to the ELISA plate in duplicate: 50 uL to each well.

6. Incubate at 37° C. for 1 hr in a humidified container.

7. Wash plates 5 times with PBS-Tween, rotate and wash 5 more times, then tap to dry.

8. Dilute conjugate (antiporcine IgG, horseradish peroxidase conjugated) in sample diluent and add 50 uL to each well.

9. Incubate at 37° C. for 1 hr in a humidified container.

10. Wash plates 10 times with PBS-Tween, then 5 times with purified water.

11. Develop by adding 100 uL of TMB substrate to each well. Incubate at 37° C. in the dark for about 10 min until target OD is achieved for controls. A commercially available TMB substrate can be used (eg. Boehringer Mannheim Corp., Pierce Chemical Co., and Kirkegaard & Perry Laboratories).

12. Stop by adding 100 uL of 1M sulphuric acid.

13. Read OD values at 450 nm.

14. Calculate results.

Example 3

Enzyme Linked Immunosorbent Assay to Detect Antigens of PMC Virus

[0580] It should be noted that working solutions of the detector reagent and enzyme conjugate reagents should be made within approximately 1 hour of anticipated use and then stored at 4° C.

[0581] Materials

[0582] ELISA Wash Buffer—10× concentrate: 1 M Tris; HCl (6.25 Normal) for pH adjustment; 0.01% Thimerosal; and 5% Tween 20.

[0583] Detector Reagent—10× concentrate: 25% Ethylene Glycol, 0.01% Thimerosal, approximately 5% biotinylated goat anti-PMC virus antibody, and 0.06% yellow food colouring in PBS (pH 7.4). The working Detector Reagent is prepared by mixing 1 part of the Detector Reagent—10× concentrate, 1 part of NSB Reagent 10× concentrate, and 8 parts of Reagent Diluent Buffer. This working agent should be prepared within approximately 1 hour of anticipated use.

[0584] NSB Reagent—10× concentrate: 25% Ethylene Glycol, 0.01% Thimerosal, 0.2% Mouse IgG, 0.06% red food colouring in PBS (pH 7.4).

[0585] Reagent Diluent Buffer: 2.5% Bovine Serum Albumin, 0.01% Thimerosal, and 1.0% bovine gamma globulin in PBS (pH 7.4).

[0586] Enzyme Conjugate Reagent—10× concentrate: 25% Ethylene Glycol, 0.01% Thimerosal, streptavidin-biotinylated horseradish peroxidase complex (dilution approximately 1 to 700), 0.1% rabbit albumin, and 0.02% rabbit gamma globulin in PBS (pH7.4). Working Enzyme Conjugate Reagent should be prepared by mixing 1 part of Enzyme Conjugate Reagent—10× concentrate, 1 part of NSB Reagent—10× concentrate, and 8 parts of Reagent Diluent buffer. This working reagent should be prepared within approximately 1 hour of anticipated use.

[0587] Negative Control: 1% Igepal, and 0.01% Thimerosal in PBS (pH 7.4).

[0588] Positive Control: 1% Igepal, 0.01% Thimerosal, 1% Bovine Serum Albumin, PMC virus culture (dilution approximately 1:20) and 50 μM phenyl methyl sulfonyl fluoride in PBS (pH7.4).

[0589] Method

1. Prepare specimens by standard methods. For samples containing cells (tissues, white blood cells) homogenise the tissue and add sample lysis buffer (1% NP40). Allow at least 1 hour for antigen extraction and mix continually.

2. Clarify specimens by centrifuging for 15 minutes at approximately 2000 g;

3. Coat 96 well microplates with purified polyclonal antiserum raised against PMC virus antigens (100 uL/well). Alternatively, a mixture of anti-PMC virus monoclonal antibodies may be used. Each 96-well tray is coated overnight at room temperature with 0.1 ml per well of a solution containing purified antibody at 5 μg/ml and bovine serum albumin at 10 μg/ml in carbonate buffer (pH9.6). Following the coating, each tray is washed three times with ELISA wash buffer and allowed to dry overnight at 4° C. A foil pouch is used to encase each tray after drying, and a desiccant is included inside each pouch to remove moisture.

4. Wash ELISA plates 3 times by pipetting 0.2 ml of ELISA Wash Buffer into each well and tap or pipette dry prior to the addition of sample.
5. Block ELISA plates with Blocking solution 1 (200 uL/well) for 30 min at 37° C. in a humidified container.
6. Transfer 100 uL of each specimen (including controls) to the ELISA plate;
7. Incubate plates for 60 min at 37° C. in a humidified container;
8. Wash ELISA plates 5 times with ELISA Wash Solution;
9. Block ELISA plates with Blocking Solution 2 (150 uL) for 30 min at 37° C. in a humidified container;
10 Wash ELISA plates 5 times;
11. Add Detector Reagent containing biotinylated anti-PMC virus monoclonal antibody (100 uL) to all wells;
12 Incubate plates for 60 min at 37° C. in a humidified container;
13 Wash plates 5 times;
14. Add Enzyme Conjugate Reagent containing streptavidin-biotinylated horseradish peroxidase complex and add 100 uL to all wells;
15. Incubate plates for 30 min at 37° C. in a humidified container;
16. Wash plates 10 times;
17. Prepare and add 100 uL of TMB substrate solution to all wells. A commercially available TMB substrate may be used (eg. Boehringer Mannheim Corp, Pierce Chemical Co, and Kirkegaard & Perry Laboratories).
18. Incubate plates for approx 10 min at room temperature in the dark;
19. Stop reaction with 1M sulphuric acid (100 uL per well);
20. Read ODs on ELISA plate reader at 450 nm;
21. Calculate results.

Example 4

Detection of PMC Virus RNA by Reverse Transcriptase (RT) Polymerase Chain Reaction (PCR)

[0590] a) Extract RNA from the test specimen as described in Example 1. Include in all steps of the reactions known positive and negative controls and a 'blank'.

[0591] b) Reverse transcribe (RT) the RNA as follows:

[0592] 1. Mix together the following:

random hexamers (50 pmol)	1 ul
RNA (in H2O)	9 ul

[0593] 2. Heat at 90° C. for 3 minutes, spin and put on ice

[0594] 3. On ice add:

1st strand buffer	4 ul
0.1M dTT	2 ul
5 mM dNTP	2 ul
SSIII (200 U)	1 ul

[0595] 4. Mix, spin heat at 45° C. for 60 minutes.

[0596] 5. Heat inactivate at 70° C. for 10 minutes

[0597] 6. Place on ice.

[0598] c) Set up 1st round PCR

[0599] 1. Mix together the following PCR reagents

RT	5 ul
Forward primer 4 uM	1 ul
Reverse primer 4 uM	1 ul
Hotstart PCR mix (Qiagen)	12.5 ul
Water	5.5 ul

(see Table 3 for 1st reaction PCR primers)

[0600] 2. Cycle the PCR machine at:

[0601] 95° C. for 15 minutes

[0602] (94° C. for 30 sec, 50° C. for 30 sec, 72° C. for 1 min)×40

[0603] 72° C. for 1 min

[0604] 4° C. hold

[0605] d) Set up Nested PCR

[0606] 1. Mix together the following PCR reagents:

1st PCR product	1 ul
Forward nested primer 20 uM	1 ul
Reverse nested primer 20 uM	1 ul
Hotstart PCR mix (Qiagen)	12.5 ul
Water	9.5 ul

(see Table 3 for nested PCR primers. If no nested primer is listed, use 1st PCR primer)

[0607] 2. Cycle the PCR machine at

[0608] 95° C. for 15 minutes

[0609] (94° C. for 30 sec, 50° C. for 30 sec, 72° C. for 1 min)×25

[0610] 72° C. for 1 min

[0611] 4° C. hold

[0612] e) Run 5 ul of nested PCR product on a 1.5% ethidium bromide gel for 1 hour. Depending on the primers used, the expected size of the product is as listed in Table 1.

TABLE 3

Primers for PCR detection of PMC virus

Clone	Virus	*Primer name	Primer Sequence (5' to 3')	Nested Product size
CR3 9	Pestivirus	CR39F (63)	CACATCTAGCAGCAGACTATGA	103 bp
		CR39R (190)	GTACCAGTTGCACCACCC	
		CR39FN (87)	TGAAAAGGATTCACGG	
ER5 10	Pestivirus	ER510F (7)	AAACCGACGAAGTAGACC	114 bp
		ER510R (213)	AGACGAGAACATAGTGGC	
		ER510FN (68)	GAAACAGTAAAGCCAACG	
		ER510RN (182)	CTGGTAATCGGAAACATC	

TABLE 3-continued

Primers for PCR detection of PMC virus

Clone	Virus	*Primer name	Primer Sequence (5' to 3')	Nested Product size

		ER55FN (64)	GACGGGAATGGGTTCA	
		ER55RN (162)	TAGGTGCTTCTTATTGGTAT	

*F = forward primer, R = reverse primer, FN = forward nested primer, RN = reverse nested primer

Example 5

Determination of Full length viral sequence

[0613] Once the authenticity of the presence of PMC virus sequence has been confirmed in a sample by PCR, the entire viral sequence can be acquired by designing PCR primers to span the gaps between the clones (refer to Table 4). RT-PCR was carried out as either a two step (RT then PCR) or one step RT-PCR reaction.

1. RT Reaction:

[0614] a) Mix together the following:

[0615] 1 ul random hexamers (50 pmol)

[0616] 4 ul RNA

[0617] 4 ul Rnase free water

[0618] b) Heat 70° C. 10 minutes, spin and put on ice

[0619] c) On ice add

[0620] 4 ul 1st strand buffer

[0621] 2 ul 0.1M dTT

[0622] 2 ul 5 mM dNTP

[0623] 2 ul SSIII (400 U)

[0624] d) Mix, spin heat at 42° C. for 60 minutes.

[0625] e) Heat inactivate at 70° C. for 10 minutes

[0626] f) Place on ice

2. PCR Reaction:

[0627] a) Mix together the following PCR reagents

RT	1 ul
Forward primer 20 uM	1 ul
Reverse primer 20 uM	1 ul
Hotstart PCR mix (Qiagen)	12.5 ul
Water	13.5 ul

(see Table 4 for PCR primers)

[0628] b) Cycle the PCR machine at:

[0629] 95° C. for 15 minutes

[0630] (94° C. for 30 sec, 47° C. for 30 sec, 72° C. for 2 min)×40

[0631] 72° C. for 1 min

[0632] 4° C.—hold

3. One Step RT-PCR Method

[0633] a) Mix together the following reagents from the SSIII RT-PCR Kit

2x reaction mix	25	ul
Forward primer 30 uM	1	ul
Reverse primer 30 uM	1	ul
SSIII RT/Platinum mix	2	ul for products 2.5 kb or less
	4	ul for products 2.5 kb or more
Water	15.8	ul for products 2.5 kb or less
	13.8	ul for products 2.5 kb or more

(see Table 4 for PCR primers)

[0634] b) Cycle the PCR machine at:

[0635] 50° C. for 50 minutes

[0636] 94° C. for 2 min

[0637] (94° C. for 15 sec, 50° C. for 30 sec, 68° C. for 1 min/kb)×40

[0638] 68° C. for 5 min

[0639] 4° C.—hold

[0640] RT-PCR product of interest was PCR spin cleaned and cloned into the Invitrogen TA cloning vector PCR2.1 (see Example 1). Positive clones were then identified and sent for sequencing, as described in Example 1.

[0641] The primers used for sequencing were M13r, m13-20, primers in Table 4 and primers designed specifically for sequencing (see Table 5).

[0642] Plasmid sequence, PCR primers and poor sequence reads were removed from the sequence before being used in the program Bioedit (Hall, T. A. (1999) BioEdit: a user-friendly biological sequence alignment editor and analysis program for Windows 95/98/NT. Nucl. Acids. Symp. Ser. 41:95-98). Bioedit allowed the construction of contigs and the production of the full length consensus sequence for the virus.

Example 6

UTR Sequences

[0643] 5'RACE and 3'Race were used to aquire the 5'UTR and 3'UTR sequences.

1. 5' RACE Method

[0644] Sequence data from the complete 5' untranslated region (UTR) was generated using rapid amplification of cDNA ends (RACE, BD), as described by BD Biosciences Clonetech with the following modifications. PMC virus-specific primer CR24R (5'TCCCCGAAGCTTGGTTTAAT 3') was used to generate the cDNA. Hotstart PCR (Qiagen) was carried out with primers CR39R (Table 3) and BD Universal primer A mix (5'CTAATACGACTCACTATAGGGCAAGCAGTGGTATCAACGCAGAGT3' and 5'CTAATACGACTCACTATAGGGC3') with an annealing temperature of 67° C. and extension time of 2 minutes. The PMC virus specific primer N^{Pro}(630)RS (Table 5) and BD nested Universal Primer A (5'AAGCAGTGGTATCAACGCAGAT3') were used for the Hotstart Nested PCR, with an annealing temperature of 55° C. and an extension time 2 minutes. Nested PCR products were cleaned, cloned and sequenced.

2. 3' RACE Method

[0645] Sequence data from the complete 3' untranslated region was generated by first adding a poly (A) tail to the viral RNA, using Epicentre's A-Plus Ploy(A) polymerase tailing Kit for 8 minutes. This was followed by rapid amplification of cDNA ends (RACE, BD), as described by BD Biosciences Clonetech with the following modifications. Hotstart PCR (Qiagen) was carried out with primers ER62F (Table 3) and BD Universal primer A mix (5'CTAATACGACTCACTATAGGGCAAGCAGTGGTATCAACGCAGAGT3' and 5'CTAATACGACTCACTATAGGGC3') with an annealing temperature of 65° C. and extension time of 2 minutes. The PMC virus specific primer NS5B(12100)F (Table 5) and BD nested Universal Primer A (5'AAGCAGTGGTATCAACG-

CAGAT3') were used for the Hotstart Nested PCR, with an annealing temperature of 65° C. and an extension time 2 minutes. Nested PCR products were cleaned, cloned and sequenced.

Example 7

Real Time PCR

[0646] The following primers and a matching probe based on Taqman® technology were developed:

```
Forward primer:     CAGTTGGTGTGATCCATGATCCT

Reverse primer:     GGCCTCACCCTGCAACTTT

Probe:              6FAMAAGTCTTCAGCAGTTAACTMGBNFQ
```

[0647] Similar primer/probe combinations may be developed for other segments of the PMC genome.

[0648] A Real Time PCR assay was carried out using the following steps:

a) Extract RNA from the test specimen. Include in all steps of the reactions known positive and negative controls and a 'blank'.

b) Prepare reaction mixture (volumes per sample) as follows:

2x Mastermix (Roche)	12.5 uL
40x Multiscribe	0.625 uL
Forward primer	1 uL
Reverse Primer	1 uL
Taqman Probe	1 uL
Template (sample)	2 uL
Water	6.875 uL

c) Set up cycling conditions for the PCR cycler available (the cycles below are appropriate for a Cepheid Smartcycler)

[0649] Cycle the PCR machine at:

[0650] Stage 1: Repeat 1×

[0651] 48° C. for 30 min

[0652] 95° C. for 10 min

[0653] Stage 2: Repeat 45×

[0654] 95° C. for 15 secs

[0655] 58° C. for 30 secs each

d) Determine results using the Smartcycler software using cycle-threshold (CT) values. A CT value of <35 is considered to be positive. Values between 35-40 are suspicious and values >40 are negative.

Example 8

Production of Recombinant Baculoviruses and Expression of Recombinant PMC Virus Proteins

1. Cloning of PCR Fragments

[0656] PCR products are purified with PCR SPINCLEAN™ columns (Progen Industries, Limited), according to the manufacturer's instructions. If the PCR reaction produces non-specific bands in addition to the required product, or subcloning from another plasmid was necessary, the DNA can be further purified by elution from a 0.8% agarose gel, using a modification of the method described by Heery (1990).

[0657] Purified PCR fragments are digested and ligated into pBlueBacHis A, B or C baculovirus transfer vectors (MaxBac Baculovirus Expression System, Invitrogen Corporation) containing compatible cohesive overhangs, using standard cloning protocols (Sambrook et al., 1989; Current Protocols in Molecular Biology, 1991). A, B or C vectors provide three different reading frames to achieve protein expression in the baculovirus expression system.

2. Transformation of Baculovirus Plasmids with the PCR Fragments

[0658] The ligations are transformed into competent *E. coli* strain Top 10 (Invitrogen Corporation), Genotype: FmcrA D(mrr-hsdRMS-mcrBC) f80lacZDM15 DlacX74 deoR recA1 araD139 D(ara-leu)7697 galU galK rpsL endA1 nupG, and/or Sure® *E. coli* (Stratagene), Genotype: e14^{-}(McrA^{-})D (mcrCB-hsdSMR-mrr) 171 endA1 supE44 thi-1 gyrA96 rel A1 lac recB recJ sbcc umuc::Tn5 (kan^{r}) uurC[F' proAB lacI^{q}Z D m15 Tn10(Tet^{r})]^{c}. Protocols for the preparation of competent cells and transformation of the bacteria are taken from the Invitrogen MaxBac Baculovirus Expression System Manual Version 1.8.

[0659] Screening bacterial clones for plasmid containing PCR fragment and plasmid purification for transfection

[0660] Bacterial clones containing pBlueBacHis+PCR fragment are identified by growing colonies, extracting the plasmids using the boiling miniprep method described in Sambrook, et al. (1989), and then undertaking restriction digests of the plasmids to verify those containing the correct-sized insert. Recombinant plasmids are purified to a level suitable for transfection reactions using plasmid purification kits (QIAGEN Pty Ltd., tip-20 or tip-100 columns), according to the manufacturer's instructions.

3. Production of Purified Recombinant Baculoviruses by Cationic Liposome Transfection of Sf9 Cells to Produce Recombinant Baculoviruses

[0661] Recombinant baculoviruses are produced by co-transfecting linearised wild-type *Autographa californica* nuclear polyhedrosis virus (AcMNPV) DNA and baculovirus transfer vector containing PCR fragment into Sf9 cells, by the technique of cationic liposome mediated transfection. This is carried out according to the Invitrogen MaxBac Baculovirus Expression System Manual Version 1.8.

4. Plaque Purifying Recombinant Baculoviruses

[0662] Recombinant virus is plaque purified three times before virus master stocks are prepared, ensuring the virus is cloned from a single particle and no wild-type virus is present. Plaque assays are set up according the Invitrogen MaxBac Baculovirus Expression System Manual Version 1.8.

[0663] After each round of plaque purification, the recombinant viruses are screened using a modified Pestivirus antigen-capture ELISA (PACE) (Shannon et al., 1991). The modified method involves supernatant + cells (50 μl/well) being added directly to a blocked, washed ELISA plate, and the plate incubated for 1 hr at 37° C. Antibody solution (50 μl/well) is then added. The antibody used is either biotinylated goat anti-pestivirus antiserum or individual anti-PMC virus monoclonal antibodies (mAbs). The plate is incubated overnight at 22° C., then developed as described by Shannon et al. (1991), omitting the incubation with biotinylated anti-mouse IgG for samples that are reacted with the biotinylated goat antiserum.

5. Recombinant Baculovirus Master, Seed and Working Stocks

[0664] The master virus stock for each of the recombinant baculoviruses constructed are made according the Invitrogen

MaxBac Baculovirus Expression System Manual Version 1.8. The titre of the stock is determined by a plaque assay, as described above, except that the cells are overlaid with 1.5% carboxymethylcellulose (CMC, BDH; 6% CMC in deionised water, diluted 1 in 4 with complete TC100+X-gal [125 μg/ml, Boehringer Mannheim]). After 7 days, the blue plaques are counted to give the virus titre.

[0665] The seed and working stock are made from the master and seed stock, respectively using a low MOI of 0.1 to 0.5 pfu/ml. All virus stocks are stored at 4° C. for use in vaccine production. For long term storage of Master, Seed and Working stocks, each recombinant virus is ampouled and frozen at −80° C.

6. Optimisation of Recombinant Protein Production

[0666] Sf9 insect-cell suspensions, adapted to Sf-900 II Serum Free Media according to the protocol described by Gibco BRL (1995), are used to optimise recombinant protein expression. Two conical flasks, containing 50 ml cells (1.5×10^6 cells per ml), are infected with recombinant baculovirus at a high and low MOI, between 0.1 and 5.0. A third flask acts as an uninfected control culture. The 3 flasks are incubated with shaking at 28° C., and 5 ml aliquots removed at 24 hr intervals for up to 7 days.

[0667] The samples are centrifuged at room temperature (RT) for 10 min at 900×g, and the supernatants carefully removed. The pellets and supernatants are stored at −20° C. until daily sampling is completed. The amount of specific, recombinant pestivirus protein in the samples is then determined using the modified PACE described above. The cell pellets are reconstituted in 200 μl or 250 μl NP-40 (1% [v/v] in PBS), vortexed and centrifuged at RT for 10 min at 900×g. Serial dilutions of the pellet extract (in 1% [v/v] NP40) are assayed. The culture supernatants are assayed undiluted, as well as serially diluted (in 1% [v/v] NP40). If cell viability is reduced at a higher rate of infection, then an MOI or 0.1 to 2 is more appropriate.

[0668] Modifications of the above-described modes of carrying out the various embodiments of this invention will be apparent to those skilled in the art based on the above teachings related to the disclosed invention. The above embodiments of the invention are merely exemplary and should not be construed to be in any way limiting.

1. An isolated RNA nucleotide sequence comprising:
a) SEQ ID NO:1, wherein thymidine (t) nucleotides are substituted with uridine (u) nucleotides;
b) an RNA sequence substantially homologous to the nucleotide sequence of (a);
c) an RNA sequence comprising the complement of the nucleotide sequence of (a);
d) fragments of any one of (a), (b) or (c);
e) any one of SEQ ID NOs:3-15; or
f) variants of any one of (a)-(e).

2. The sequence fragment of claim **1** selected from the group consisting of the following locations of SEQ ID NO: 1: position 419-922, 923-1219, 1220-1885, 1886-2473, 2474-3604, 3605-3820, 3821-5224, 5225-7252, 7253-7441, 7442-8482, 8483-9997 and 9998-12077.

3. An isolated DNA sequence comprising:
a) SEQ ID NO: 1;
b) a DNA sequence substantially homologous to SEQ ID NO:1;
c) a DNA sequence comprising the complement of SEQ ID NO:1;
d) fragments of any one of (a), (b) or (c);
e) any one of SEQ ID NOs:3-15; or
f) variants of any one of (a)-(e).

4. The sequence of claim **3** selected from the group consisting of the following locations of SEQ ID NO:1: position 419-922, 923-1219, 1220-1885, 1886-2473, 2474-3604, 3605-3820, 3821-5224, 5225-7252, 7253-7441, 7442-8482, 8483-9997 and 9998-12077.

5. An isolated amino acid sequence comprising:
a) SEQ ID NO:2;
b) polypeptide encoded by the nucleotide of claim **1**;
c) any one of SEQ ID NOs:16-27;
d) fragments of (a) or (b);
e) variants of any one of (a)-(d).

6. The sequence of claim **5** selected from the group consisting of the following locations in SEQ ID NO:2: 1-167, 168-267, 268-489, 490-685, 686-1062, 1063-1134, 1135-1602, 1603-2278, 2279-2341, 2342-2688, 2689-3193 and 3194-3886.

7. A method for detecting the presence of a PMC virus amino acid sequence according to claim **5** in a sample, comprising the steps of:
a) contacting a sample suspected of containing a PMC virus amino acid sequence with an antibody that specifically binds to the PMC virus amino acid sequence under conditions which allow for the formation of reaction complexes comprising the antibody and the PMC virus amino acid sequence; and
b) detecting the formation of reaction complexes comprising the antibody and PMC virus amino acid sequence in the sample, wherein detection of the formation of reaction complexes indicates the presence of PMC virus amino acid sequence in the sample.

8. A method for detecting the presence of an anti-PMC virus antibody in a sample, comprising the steps of:
a) contacting a sample suspected of containing an anti-PMC virus antibody with an amino acid sequence according to claim **5** under conditions which allow for the formation of reaction complexes comprising the PMC virus antibody and the amino acid sequence; and
b) detecting the formation of reaction complexes comprising the antibody and amino acid sequence in the sample, wherein detection of the formation of reaction complexes indicates the presence of PMC virus antibody in the sample.

9. A method for the detection and evaluating the levels of anti-PMC virus antibodies in a subject, comprising the steps of:
a) depositing a predetermined amount of one or several PMC virus antigens comprising an amino acid sequence according to claim **5** onto a solid support such as a microplate;
b) introducing increasing dilutions of a biological fluid (e.g., blood serum or plasma, milk, cerebrospinal fluid, lymphatic fluid or other body fluids) onto the antigens and incubating;
c) washing the solid support with an appropriate buffer;
d) adding specific labelled antibodies directed against the antibodies of the subject;
e) detecting the antigen-antibody-antibody complex formed, which is then indicative of the presence of anti-PMC virus antibodies in the biological fluid; and
f) evaluating the amount of reaction complexes formed, which amount of reaction complexes corresponds to the level of PMC virus antibodies in the biological sample.

10. The method of claim **9** wherein the levels of PMC virus antibodies are determined in a series of biological samples obtained at different time points from an animal host undergoing therapeutic treatment.

11. A method for detecting the presence or absence of PMC virus in a biological sample, comprising the steps of:
a) bringing the biological sample into contact with a polynucleotide probe or primer comprising:
i. an isolated RNA nucleotide sequence according to claim **1**, or
ii. an isolated DNA sequence comprising:
1) SEQ ID NO: 1;
2) a DNA sequence substantially homologous to SEQ ID NO:1;
3) a DNA sequence comprising the complement of SEQ ID NO:1;
4) fragments of any one of (1), (2) or (3);
5) any one of SEQ ID NOs:3-15; or
6) variants of any one of (1)-(5),
under suitable hybridizing conditions; and
b) detecting any duplex formed between the probe or primer and nucleic acid sequences in the sample.

12. A method for the detection of PMC virus nucleic acids present in a biological sample, comprising:
a) amplifying the DNA sequence of claim **3** with at least one primer,
b) detecting the amplified nucleic acids.

13. A method for the detection of PMC virus nucleic acids present in a biological sample, comprising:
a) hybridizing the nucleic acids of the biological sample at appropriate conditions with one or more probes comprising:
i. an isolated RNA nucleotide sequence according to claim **1**, or
ii. an isolated DNA sequence comprising:
1) SEQ ID NO: 1;
2) a DNA sequence substantially homologous to SEQ ID NO:1;
3) a DNA sequence comprising the complement of SEQ ID NO:1;
4) fragments of any one of (1), (2) or (3);

5) any one of SEQ ID NOs:3-15; or
6) variants of any one of (1)-(5),

b) washing under appropriate conditions, and

c) detecting the hybrids formed.

14. A method for detecting viral RNA or DNA comprising the steps of:

a) immobilizing PMC virus on a support;

b) disrupting the virion; and

c) hybridizing the nucleic acids of the virion with a probe comprising:

i. an isolated RNA nucleotide sequence according to claim **1**, or

ii. an isolated DNA sequence comprising:

1) SEQ ID NO: 1;
2) a DNA sequence substantially homologous to SEQ ID NO:1;
3) a DNA sequence comprising the complement of SEQ ID NO:1;
4) fragments of any one of (1), (2) or (3);
5) any one of SEQ ID NOs:3-15; or
6) variants of any one of (1)-(5).

15. A method for screening the tissue of subjects for PMC virus comprising the steps of:

a) extracting DNA from tissue;

b) restriction enzyme cleavage of said DNA;

c) electrophoresis of the fragments; and

d) Southern blotting of genomic DNA from tissues and subsequent hybridization with a labelled cloned PMC virus DNA sequence according to claim **3**.

16. A method for the generation of antibodies comprising the steps of:

a) providing a PMC virus polypeptide sequence comprising an amino acid sequence of claim **5** to a subject; and

b) collecting the antibodies generated in the subject against the polypeptide.

17. The method of claim **16** wherein the polypeptide is further coupled or covalently conjugated to a physiologically acceptable carrier molecule.

18. A vaccine composition comprising a PMC virus polypeptide that comprises an amino acid sequence according to claim **5**.

19. A vaccine composition comprising:

i. an isolated RNA nucleotide sequence according to claim **1**, or

ii. an isolated DNA sequence comprising:

1) SEQ ID NO: 1;
2) a DNA sequence substantially homologous to SEQ ID NO:1;
3) a DNA sequence comprising the complement of SEQ ID NO:1;
4) fragments of any one of (1), (2) or (3);
5) any one of SEQ ID NOs:3-15; or
6) variants of any one of (1)-(5).

20. The composition of claim **18** wherein the composition further comprises a pharmaceutically acceptable carrier or diluent and/or an adjuvant.

21. A method to vaccinate an animal against PMC comprising the steps of: providing a vaccine according to claim **18** to the animal in an amount effective for producing protection against a pestivirus infection.

22. The method of claim **21** wherein the immunogenic composition is administered by a method selected from the list comprising: intravenously, subcutaneously, intramuscularly, intraorbitally, ophthalmically, intraventricularly, intracranially, intracapsularly, intraspinally, intracisternally, intraperitoneally, buccal, rectally, vaginally, intranasally, orally or aerosol administration.

23. A pharmaceutical composition comprising a PMC virus amino acid sequence according to claim **5** in a therapeutically effective amount admixed with a pharmaceutically acceptable carrier, diluent, or excipient.

24. A pharmaceutical composition comprising antibodies prepared against PMC polypeptides comprising an amino acid sequence of claim **5**.

25. A therapeutic composition comprising a nucleic acid sequence selected from the group consisting of:

i) an isolated RNA nucleotide sequence comprising:

1) SEQ ID NO:1, wherein thymidine (t) nucleotides are substituted with uridine (u) nucleotides;
2) an RNA sequence substantially homologous to the nucleotide sequence of (1);
3) an RNA sequence comprising the complement of the nucleotide sequence of (1);
4) fragments of any one of (1), (2) or (3);
5) any one of SEQ ID NOs:3-15; or
6) variants of any one of (1)-(5);

ii. an isolated DNA sequence comprising:

1) SEQ ID NO: 1;
2) a DNA sequence substantially homologous to SEQ ID NO:1;
3) a DNA sequence comprising the complement of SEQ ID NO:1;
4) fragments of any one of (1), (2) or (3);
5) any one of SEQ ID NOs:3-15; or
6) variants of any one of (1)-(5); and

iii. an antisense or ribozyme polynucleotide sequence hybridizable to a polynucleotide sequence encoding a PMC virus amino acid sequence according to claim **5**.

26. A method of ameliorating a disease associated with PMC virus comprising administering to a subject a PMC virus amino acid sequence according to claim **5**, wherein said PMC virus amino acid sequence ameliorates said disease associated with PMC virus.

27. A method of ameliorating a disease associated with PMC virus comprising administering to a subject antibodies against the PMC virus, wherein said antibodies against the PMC virus ameliorate said disease associated with PMC virus.

28. A method of ameliorating a disease associated with PMC virus comprising administering to a subject a PMC virus nucleic acid sequence, or an antisense or ribozyme polynucleotide sequence hybridizable to a polynucleotide sequence encoding a PMC virus amino acid sequence according to claim **5**, wherein said a PMC virus nucleic acid sequence, or an antisense or ribozyme polynucleotide sequence hybridizable to a polynucleotide sequence encoding a PMC virus amino acid sequence ameliorates said disease associated with PMC virus.

29. A method of inducing a protective immune response in an animal or human against a PMC virus comprising the step of:

a) administering to said animal or human an effective amount of a composition comprising anti-PMC virus antibodies that are specific to an amino acid sequence according to claim **5**.

30. A method for enhancing an animal's immunocompetence and the activity of its immune effector cells against a PMC virus comprising the step of:

a) administering a composition comprising a therapeutically effective amount of a PMC virus peptide or polypeptide that comprise an amino acid according to claim **5**.

31. A live vector comprising:

i. an isolated RNA nucleotide sequence according to claim **1**, or

ii. an isolated DNA sequence comprising:

1) SEQ ID NO: 1;

2) a DNA sequence substantially homologous to SEQ ID NO:1;

3) a DNA sequence comprising the complement of SEQ ID NO:1;

4) fragments of any one of (1), (2) or (3);

5) any one of SEQ ID NOs:3-15; or

6) variants of any one of (1)-(5)

and a heterologous polynucleotide.

32. The live vector of claim **31** wherein the heterologous polynucleotide is operably linked to the polynucleotide sequence of the PMC virus, such that expression of the polynucleotide sequence of the PMC virus also leads to expression of the heterologous polynucleotide sequence.

33. The vector of claim **31** wherein one or more sections of autologous polynucleotide sequence are removed such that the live virus is rendered attentuated in pathogenicity in a host subject.

34. A method of screening for drugs comprising the steps of:

a) contacting an agent with a PMC virus amino acid sequence according to claim **5** and

b) assaying for the presence of a complex between the agent and the PMC virus amino acid sequence.

35. A method of screening for ligands of the proteins of the PMC virus comprising the steps of:

a) contacting a ligand with a PMC virus amino acid sequence according to claim **5**; and

b) assaying for the presence of a complex between the PMC virus amino acid sequence or fragment and a ligand.

36. A kit for the demonstration of the presence of PMC virus comprising:

(a) a predetermined amount of at least one labelled immunochemically reactive component obtained by the direct or indirect attachment of a PMC virus amino acid sequence according to claim **5** or a specific binding partner thereto, to a detectable label;

(b) other reagents; and

(c) directions for use of said kit.

37. A kit for demonstrating the presence of PMC virus comprising:

(a) a predetermined amount of at least one labelled antibody specific for an amino acid sequence of claim **5**;

(b) other reagents; and

(c) directions for use of said kit.

38. A diagnostic kit for demonstrating the presence of PMC virus comprising:

(a) a predetermined amount of at least one labelled polypeptide comprising an amino acid sequence of claim **5** derived from the PMC virus;

(b) other reagents; and

(c) directions for use of said kit.

39. A kit for demonstrating the presence of PMC virus comprising:

(a) a predetermined amount of at least one labelled nucleic acid sequence derived from the PMC virus, wherein said nucleic acid sequence comprises:

i. an isolated RNA nucleotide sequence according to claim **1**, or

ii. an isolated DNA sequence comprising:

1) SEQ ID NO: 1;

2) a DNA sequence substantially homologous to SEQ ID NO:1;

3) a DNA sequence comprising the complement of SEQ ID NO:1;

4) fragments of any one of (1), (2) or (3);

5) any one of SEQ ID NOs:3-15; or

6) variants of any one of (1)-(5);

(b) other reagents; and

(c) directions for use of said kit.

40. A recombinant expression vector comprising a PMC virus nucleic acid sequence or a part thereof of claim **1**, operably linked to prokaryotic, eukaryotic or viral transcription and translation control elements.

41. A host cell transformed by the vector of claim **40**.

42. A method for preparing a PMC virus amino acid sequence according to claim **5**, comprising the steps of:

(a) culturing a host cell containing a vector according to claim **40** under conditions that provide for expression of the PMC virus amino acid sequence; and

(b) recovering the expressed PMC virus sequence.

43. The composition of claim **19** wherein the composition further comprises a pharmaceutically acceptable carrier or diluent and/or an adjuvant.

44. A method to vaccinate an animal against PMC comprising the steps of: providing a vaccine according to claim **19** to the animal in an amount effective for producing protection against a pestivirus infection.

45. The method of claim **44** wherein the immunogenic composition is administered by a method selected from the list comprising: intravenously, subcutaneously, intramuscularly, intraorbitally, ophthalmically, intraventricularly, intracranially, intracapsularly, intraspinally, intracisternally, intraperitoneally, buccal, rectally, vaginally, intranasally, orally or aerosol administration.

46. A recombinant expression vector comprising a PMC virus nucleic acid sequence or a part thereof of claim **3**, operably linked to prokaryotic, eukaryotic or viral transcription and translation control elements.

47. A host cell transformed by the vector of claim **46**.

48. A method for preparing a PMC virus amino acid sequence, comprising the steps of:

(a) culturing a host cell containing a vector according to claim **46** under conditions that provide for expression of the PMC virus amino acid sequence; and

(b) recovering the expressed PMC virus sequence
